Andrew Tobias:
How to Manage
Money with
Your IBM PC

**Price Waterhouse
Report: The
Case for Attaché**

**"I DON'T MEAN TO
BRAG, BUT EVERY-
ONE IN MY COM-
PANY
AGREES
I MAKE
THE
MOST
HEAVENLY
PIES IN
THE WORLD."**

Somebody has to be better than everybody else.

It's inevitable.

Somebody is always more determined. Works harder. And winds up on top.

Take Dysan, for instance.

We were the ones who helped develop the first 5¼" flexible diskette.

And while everybody else was trying to figure out how to make them, we were busy making them better.

With superior materials. A special lubricant and jacket liner that extend diskette life.

Unique manufacturing techniques. Like our burnishing process that helps eliminate read/write errors.

And an almost fanatical corporate commitment to quality.

What does all this mean to you?

Every Dysan diskette you buy will record and retain all your data all the time. For as long as you own the diskette and treat it right.

Dysan.

We're not just like everybody else.

Dysan 5¼" and 8" flexible diskettes are available at your computer products dealer.

Call toll free for the name of the Dysan dealer nearest you. (800) 551-9000.

Dysan Corporation, 5201 Patrick Henry Drive, P.O. Box 58053, Santa Clara, CA 95050, (408) 988-3472.

Dysan®

SIMPLE.

Dyson is a registered trademark of Dyson Corporation © 1984, Dyson Corporation

SIMPLY POWERFUL.

Basically, we agree with PFS® If you're looking for some power from software that's essentially simple, there are several PFS packages you might look at.

But if what you really want is genuinely powerful software, that's also simple to use, you'll do better with one new package from Alpha®

It's called Electric Desk™ and it's word processing, spreadsheet, communications and file management with report writing, all in a single integrated program. What's best, you can run them all at the same time, because it's all on a single disk.

So you not only get to do more work with one Electric Desk than with several PFS's. You also get to do things PFS simply can't. Like jump instantly from a letter to a budget to a customer list, over to a stock

report and back, with just a couple keystrokes. PFS makes you save files, change disks and waste a lot of time if you want to do anything like that.

Plus Electric Desk lets you do something else that's never been done before—save money. Because for \$345.00* you get a complete IBM PC/XT version of Electric Desk with all capabilities included. That's far more computing power than PFS delivers in a handful of packages for about \$600.00*.

So before you decide on software for your business, compare. We think you'll agree. When it comes to serious software, it's not how simple you make it. It's how you make it simple.

The Electric Desk. It's the new force in software simplicity.

Also available for the IBM Pcj/r. for \$295.00.

*Based on manufacturers' suggested retail prices. Electric Desk is a trademark licensed to Alpha Software Corp. by Electric Software, Inc. Alpha Software Corp. is a registered trademark. ACCOUNTS RECEIVABLE ☐ ORDER ENTRY ☐ INVENTORY CONTROL
SALES ANALYSIS ☐ ACCOUNTS PAYABLE ☐ GENERAL LEDGER ☐ PAYROLL

Whatever the product or service, it takes experience to produce quality and lasting value.

There are no inexperienced master violin makers. And so it is with software.

The staff at RealWorld Corporation have been creating packaged software products for nearly ten years. During that time, over 40,000 users have kept us in touch with reality.

We don't sell "disposable software". We haven't tried for the fanciest packaging. We won't promise "anyone can master it in ten minutes".

Mature accounting software just isn't like that.

But we will say this:

If your accounting needs are typical, and if you are willing to invest the time to read and follow our clearly written instruction manuals, RealWorld Software can work for you.

Visit your local computer store for more information, or call one of our 800 numbers for the authorized reseller nearest you.

COVER STORY

The Word on Word Processors...112
A function-by-function comparison of 19 word processing software packages, from *Bank Street Writer* to *PerfectWriter* to *XyWrite II-plus*. The story is broken into 13 sections, one for each word processing function, that correspond to the script our authors followed in editing a PC-supplied file. The authors report the procedures required to run each function with each package and then comment on the results. A function chart is included for easy comparison of the packages. The story's sections are:

• Introduction	112
• Loading the File	114
• Calling Up Help Screens	116
• Entering Data	118
• Adaptation to PC	122
• Text Adjustment	124
• Search and Replace	128
• Block Moves	130
• Paragraph Formatting	134
• Saving the File	136
• Printing the File	140
• Error Handling	142
• Exiting the Program	146
• Bells and Whistles	148
• PC Fact Files	185

FEATURES

THE PRICE WATERHOUSE REPORT
An Attaché from Down Under...190
Attaché Software has enjoyed tremendous success in Australia with its line of distinctively packaged accounting software. The company has now moved its headquarters to the United States and is pursuing an aggressive marketing plan in an attempt to put its accounting software on the United States map.

APPLICATIONS
Milk, Butter, Cheese, and PCs...204
Cheryl J. Goldberg/Stew Leonard's World's Largest Dairy Store in Norwalk, Connecticut, uses PCs to support a razzle-dazzle marketing style epitomized by the market's mascot—a lifesize plastic cow.

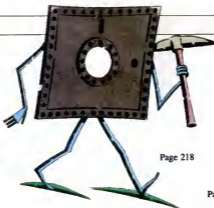

SPECIAL REPORT
Project: Database, Part 7...218
In this last installment of our series on database management packages, we'll

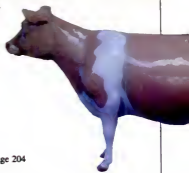

review the top-of-the-line programs, those in Category 4. These meet all of the requirements for the preceding categories; in addition, they are outstanding in some other way. The cream of the database crop includes *SAVVY PC*, *SALVO*, *Revelation*, *DataFlex*, *power-base*, *PC/FOCUS*, *informix*, *KnowledgeMan*, and last, but not least, *dBASE III*.

SOFTWARE
How to Be Your Own Best Financial Advisor...279
Eric Freedman/Best-selling financial author Andrew Tobias has turned his talents to software. In collaboration with Micro Education, he has produced a personal finance program called *Managing Your Money* that integrates financial, investment, home accounting, and tax programs for your PC. He, no doubt, hopes it will prove to be a hot seller.

Cover Photograph: Dennis Chalkin

The new HERCULES Color Card gives you the parallel port IBM forgot—for \$1 more.

And it fits into the XT's short slot.

The new Hercules Color Card gives you these five important features.

1. A parallel printer port. If you buy IBM's color card, you won't get a parallel port for a printer. Ugh. You've just wasted a valuable slot for an extra printer card.

2. It's short. Our new Color Card uses advanced gate array technology to reduce the chip count by 30 and use less than half the board space IBM does. Which makes the new Hercules Color Card perfect for the short slot in an XT.

3. Fully IBM compatible. Any program that runs on IBM's color card will run on the new Hercules Color Card. With RGB or composite video, any IBM compatible monitor will work too.

4. Hercules Graphics Card compatible. If you have a Hercules Graphics Card (model GB101 or later), or plan to buy one, an ingenious software switch on our new Color Card allows both cards to be kept in the system at the same time.

5. Low price. At a suggested list price of \$245, the new Hercules Color Card has all these features for only \$1 more than IBM's color card.

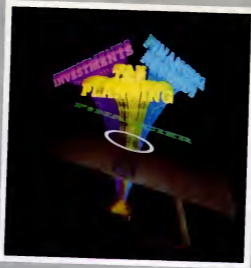

Call for our free information kit. See why the company that made the first graphics card for the IBM PC still makes the best.

Hercules. We're strong on graphics.

Suggested List Price as of 2.22.84 for the IBM Color Graphics Adapter.

No other financial software even comes close.

Introducing Financier II

Now you can have
a completely integrated financial
software system.

Now Financier II
The financial software that has met with resounding approval from professional software reviewers just got even better. Now, the Financier Personal Series has been upgraded to Financier II. Combined with Financier's Tax Series and Investor's Series, it creates a totally integrated financial management system. Financier II is so easy to use that it is ideal for personal finance yet powerful enough, and flexible enough, to function as a small business system.

"It is clear that the Financier Personal Series is the most sophisticated and flexible of the financial programs under review here."

Burton Alperson, Ph.D.
Reviewer, SOFTALK
June, 1983

Financier II features enhanced graphics capabilities, and expansion of Financier's unique auto-checking capability which prints checks directly from a user-maintained database, while updating bank, budget and tax records. Additionally it provides a full range of professional-caliber financial statements including net worth, and cash flow reports. You can even opt for double-entry accounting methods, if desired.

"Out of all these programs," the Financier Personal Series provides the best balance of extensive capabilities and ease of use. The manual is outstanding as an introduction to both the practice of bookkeeping, and the use of a personal computer to perform this task."

Steven Yoder and
Sherry Knight, CPA
PC Magazine, February, 1983

Financier II is remarkably easy to use.

You don't have to be a computer whiz-kid to use Financier II. That's because it's menu-

driven. When you need to enter data, just fill in the blanks on the pre-formatted screen. If you can use an automatic teller machine, you're well on your way to mastering this unique financial software.

Another thing that puts Financier II so far in front of any other financial software package is that it offers powerful tax and inventory functions. In fact, Financier II allows you to maintain literally thousands of these accounts, if you desire. And, each account is separately manageable.

"Thus far, no other software company has matched Financier's interlocking combination of a powerful tax-planning package (Tax Series) and a year-round record-keeping program (Personal Series)."

Augustin Hedberg
Money, June, 1983

Financier Tax and Investor's Packages.

Financier's Tax and Investor's Series provide the perfect adjunct to Financier II.

Financier's Tax Series lets you create multiple tax cases, and store them for later adjustment. You can even perform "what-if" spreadsheet calculations, generate graphics and print charts.

Financier's Investor Series is a comprehensive portfolio management system that lets you maintain a data base on each security account, each security position, and each security transaction.

Financier Offers Something for Everyone.

Individuals, businessmen, tax preparation specialists, investors or anyone who wants real financial control cannot afford to miss out on Financier's powerful software packages.

Get the most from your personal computer with the financial software that does the most. Financier II, and Financier's Tax and Investor's Series.

Can Your Word Processor Keep Up With Your 100 WPM Typist?

It can if you have WordPerfect!

Try this test. While using your favorite word processor, put the cursor in the middle of a paragraph, turn insert on, and type. Surprisingly, very few of the leading word processors can keep up with 70, 60, or even 50 words per minute. WordPerfect keeps up easily at speeds well above 100*.

Now, maybe this doesn't matter to you, because you don't type 100 or even 50 WPM. But you still don't want to wait forever to go to the beginning of your document, go to page 5, save your document, or add a paragraph.

At SSI anything less than fast is unacceptable. And not just because time is money, or because wasting time is foolish.

Delays are very frustrating, and frustration can easily lower the quality of your writing.

Try WordPerfect.

WordPerfect

**You'll love it—
not only for the
features we've built in,
but also for the
delays we left
out.**

This
"Finger
Friendly"
keyboard

Finger Friendly

will make you more productive everytime you turn on your IBM PC.

Do you love your PC, but hate its keyboard? Would you like to have a quiet keyboard, with keys in the standard typewriter position? Now there is a low cost alternative to the IBM keyboard. Look at the improvements:

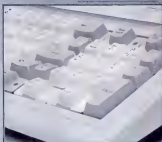

- ☐ A Wider, Left Hand Shift Key/in the Standard Typewriter Position.
- ☐ Full Width Return Key.
- ☐ Lighted Indicators on CAPS LOCK and NUM LOCK Keys.
- ☐ A Long ENTER Key Next to Ten Key Pad for Adding Machine-Like Entry.
- ☐ Long Life, Capacitive Key Switches with Micro-processor Control.
- ☐ No Irritating Clicking Sound.
- ☐ Finger Homing Bumps on F, J, and 5 Key of Numeric Pad.
- ☐ Two Stage Key Resistance Gives Tactile Feedback Through Your Fingers, not Your Ears.

And those are just the improvements! You don't have to give up the color matched, low profile case. Or three position height adjustment. It's the enhancement that will make you more productive everytime you turn on your PC.

About Us

Although we sell our products direct to you, don't confuse us with mail order companies. You see, we only sell a few selected products, which we stock in depth, and service right here in our own facilities. So you get the mail order sized price, and support based on extensive experience with our products. When you call us you get informed answers.

Whether it's a Qubie' modem, standby power system, multi-function board, or keyboard — we are ready to help you before and after the sale. And if you would rather buy from a local

dealer, no problem. Many dealers now stock Qubie' products, with more adding them each day.

All our products come with our 30 day satisfaction guarantee. If you are not completely satisfied you may return the keyboard for a refund, including the postage to send it back. In fact, we suggest you get a competitor to make the same offer, buy both products, and return the one you don't like. We know which one you'll keep.

Quadram Has Created The Perfect Color Scheme... For Quality Color Graphics From Start To Finish.

Start with Quadcolor I™ color graphics adapter board

Quadcolor is the only color graphics adapter board your IBM PC or XT will ever need. To begin, snap Quadcolor I into your PC to drive any type color monitor. You get 32K of memory for up to 16 active video pages in the 40-column text mode. Or 8 pages in 80-column. That's twice what other popular cards offer. Switch to graphics mode and create two complete screen pages in memory. Plus, you'll get two true colors in high resolution.

Grow with Quadcolor II™

Quadcolor II expands your capabilities with features like a full 16 color high resolution mode and an amazing 136 color medium resolution mode. And it comes complete with BASICQ the software package that enhances IBM's own BASICA

capabilities. When you're in the mood for fun and games, Quadcolor II even has a game port.

Choose Quadjet™ for your color graphics hard copy

Quadjet ink jet printer takes all your ideas and puts them down on paper—or transparencies. So business, scientific and engineering applica-

tions are clearer and more meaningful. And it includes an easy-to-use software package which allows you to get down to business right away.

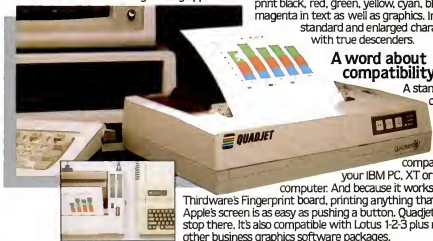

Quadjet uses plain paper or clay coated paper for the ultimate in quality color printing. You can print black, red, green, yellow, cyan, blue or magenta in text as well as graphics. Including standard and enlarged characters with true descenders.

A word about compatibility.

A standard
centronics
parallel
interface
makes
Quadjet

compatible with
your IBM PC, XT or Apple

computer. And because it works with Thirdware's Fingerprint board, printing anything that's on Apple's screen is as easy as pushing a button. Quadjet doesn't stop there. It's also compatible with Lotus 1-2-3 plus many other business graphics software packages.

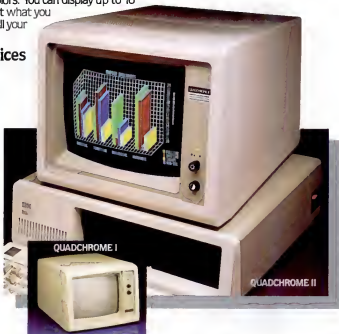

Picture Quadchrome™ as your high resolution color monitor

Quadchrome II is Quadram's latest RGB color monitor with a bigger, better 14" diagonal screen. It delivers up to 640 x 240 resolution with 80 characters by 25 lines. It's sharp, clear screen is perfect for all your business needs. Word processing. Accounting. You name it.

What's more, you'll love the colors. You can display up to 16 different colors at once. It's just what you need to add that extra flair to all your graphics work.

Monitoring your choices

The original Quadchrome I is still available. It delivers up to 690 x 480 in interlaced mode, with the same sharp image and the same colors. Only this time you'll get it on a 12" diagonal, non-glare screen. Of course, both Quadchrome I and II are FCC and UL approved. And for the best monochrome monitor around, there's Quadram's Amberchrome. The new amber monochrome monitor for the IBM PC.

Look for this seal. It's your assurance that you're buying the best in personal computer enhancements.

With Quadram, creating colorful business presentation graphics couldn't be easier. Our Quadcolor color graphics adapter board, Quadjet ink jet printer and Quadchrome color monitor all work together to deliver the finest in color and graphics. When you've got one, you'll want them all for the best color graphics you can find.

What's Inside

Magazines can have growing pains too, and new offices, PC Day West, and two major software surveys worked together to make this issue of PC a true learning experience.

Everybody, at one time or another, must go through that uncomfortable stage of existence known as adolescence. We all survived those years between childhood and adulthood, and most of us remember all too well how rocky and fraught with upheaval that period can be.

Well, magazines can have growing pains too, and *PC*'s were all too obvious to us as its editors put together this issue. Amid the usual mishaps, we were faced with the prospect of assembling an issue with two—count em, two—major software surveys: the final installment of "Project: Database" and a rundown on 19 of the most popular word processing programs on the market.

This state of confusion has been exacerbated by the approach of moving day. No, you don't have to check the address at the front of the magazine: we're still at One Park Avenue, and we hope to stay there for some time to come. However, the staff of *PC Magazine* is exchanging its cramped quarters on the seventh floor for more commodious offices on the fourth floor.

Shangri-La

This change did not come as a complete surprise; in fact, we have been looking forward to resettling in spanking new offices since December. But the

move has been postponed so many times that among staff members it has assumed the mythical status of Shangri-La—nobody really believed we would ever get to see it. When we found at the end of June that we were not only finally moving, but that we had to pack in the midst of turning out this issue, we all felt a little bit like ostriches and started searching desperately for a stray bit of sand to stick our heads in.

In the middle of all this, plans went ahead for *PC Day West*. *PC Day East*, during which *PC* editors met with our many free-lance writers on the East Coast to discuss the magazine's direction, had already been a smashing suc-

cess. So, to be fair to the other coast, most of the senior editorial staff—editor Bill Machrone, executive editors Mike Edelhart and Connie Winkler, managing editor Barry Owen, and manager of copy editing Anne Freed—hopped a plane to California. This left associate editor Stephanie Stallings to mop up "Project: Database," associate editor Barbara Krasnoff to wrestle with the word processing project, and assistant managing editor Susan Hurley to ride herd over both.

The word processing project was more of a case of cut and paste than edit and proofread. All 10 of the writers who reviewed the 19 word processors involved in the study were asked to fill out complex questionnaires covering most of the important functions a word processor is expected to perform. They also wrote short explanations of exactly how to manipulate the programs to get them to perform each of those functions.

Once all the questionnaires and reviews were in, Krasnoff and editorial assistant Roz Tobias set to work. Since the writers had reviewed the software package by package, and the format of the article demanded that the software be reviewed function by function, the reviews had to be physically cut and pasted back together again in a legible and coherent fashion.

WHAT'S INSIDE

Marathon

Then it was the copy editors' turn. In a 2-day marathon that was little short of heroic, they turned a hodge-podge of

technical directions, opinions, and writing styles into a consistent and readable group of function descriptions. The result of that effort is what we feel is an in-

formative and useful survey of the state of the word processor market.

The last part of "Project: Database" covers the databases that are so sophisticated and complex that they come under Category 4. That is they have a procedural language or the equivalent, they can handle two or more files at a time, plus they possess additional bells and whistles.

Many of these products are really application generators rather than mere database managers. Many include other utilities, such as compilers, communications, editors, graphics, and occasionally even their own operating systems.

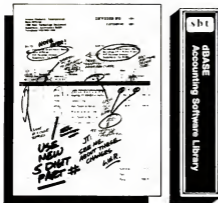

In fact the complexity of one of the products almost brought the whole project to a screeching halt. As the manuscript deadline approached, Stallings casually called one of the authors to confirm the manuscript's arrival time. The author, with trepidation in his voice, informed her that events had conspired to prevent him from even beginning to examine the database. Worse yet, he did not think he would be able to do the work at all.

Stallings hit the ceiling. The manuscript had to be on the managing editor's desk in 3 working days, and she had nobody to write it. Obviously, a command decision was needed. Stallings called in Bill Machrone to inform him of the situation. The only solution was to do a group review of the software package within the offices of PC.

Fortunately, that wasn't necessary. On the following Monday, the original reviewer called back to say that the review was completed. He had reorganized his entire schedule to devote the weekend to completing his assignment for PC. Not only was the review submitted in the nick of time, but it one of the best-written pieces in the group!

In this way, PC has weathered a rather stormy period in its growth. But like many who have had a difficult adolescence, the final result is (we modestly feel) quite outstanding. ■

SOURCE CODE INCLUDED...

for a change!

Because the dBase® Source Code is included with all SBT Accounting Software, you can add a special part number system or change a report format at will—the possibilities are endless. You get control and flexibility that's crucial to a well run business. What's more, every SBT Accounting Program can change and grow with your needs. You can make the changes yourself, or SBT will do it for you quickly and inexpensively.

Completely Integrated

Start with the modules you need now, and add the others later. Best of all, SBT Software works on all computers that can run dBase.

People are going for Friday!™ like there's no tomorrow.

Friday! is the new electronic file handling system that has become an instant best-seller because it's so revolutionary.

Within two weeks, it broke into the Top 20 on the sales chart of Softsell, one of the country's leading computer software distributors.

And it's now well on its way to the top.

The Friday! phenomenon is simple.

Friday! uses simple menus and talks to you in plain English, so almost anybody can use it.

It's great for sales and commissions, clients and portfolios, mailing lists and labels, invoices, inventories, paychecks, reports and more. And it works with other microcomputer software like 1-2-3™ and dBASE II® (our own advanced database management system).

It comes with a complete, step-by-step tutorial, but you can set up an "electronic file" without even looking at the manual, then use it at the touch of a few keys.

Friday! finds any filed information in seconds. Computes totals, subtotals, commissions, etc. Prints form letters and mailing labels. Gives you quick reports from all or part of a file with a few key-strokes. Or if you need a special report for

your bank or board of directors, just "paint" the format on your screen, then have Friday! do all the work.

And while Friday! does more than file handling systems selling for as much as \$495, it's yours for just \$295 (suggested retail price)!

For more information, contact Ashton-Tate, 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329 ext. 204. In Colorado, (303) 799-4900. In the U.K., call (0908) 568866.

Or for the name of your nearest dealer, just call 1-800-4-FRIDAY, ext. 204.

IDEAdisk. The best idea in disk drives.

There are lots of disk drive manufacturers waiting in the grass for you. They're all trying to sell you price. Or performance. Or both.

We want to set the record straight. IDEAdisk has always been the price/performance leader. We introduced built-in backup with the removable Winchester cartridge back in 1982. And we've stayed ahead of the crowd ever since.

IDEA offers better features. Higher quality. And a lower price. With IDEAdisk prices starting at \$1,645, you get more megabytes of storage for each dollar invested.

What makes IDEAdisk even better is our unique trade-up policy. The only trade-up policy in the business. So when you buy a disk drive today, and want to trade up tomorrow, you haven't wasted

your money.

You've invested it.

Every IDEAdisk undergoes rigorous testing before it is shipped. Piece by piece, and as a subsystem. This means we can offer a full year of limited warranty, compared to the industry-standard 90 days.

IDEAdisk features include:

- The best backup: Built-in backup with removable Winchester cartridge. Faster, more reliable than tape!

- The best storage combinations: 5, 10, 15, 25, 45 MB capacities. Combine two IDEAdisks and get almost 100 MB of storage. IDEAdisk Plus adds memory, serial port, and clock options without using another expansion slot.

- The best software, free.

Disk Caching: Access most frequently used files at RAM speeds. Accelerates your word processing, database, accounting applications.

Self Booting: Turn on your PC and access the hard disk directly. No floppies required.

Dynamic Partitioning: Segments the disk into logical drives for different applications or multiple (up to 40) users. Private/shared files.

Security Features: Passwords, User ID's, file and record locking.

- The best resource sharing: Fully integrated with IDEAsshare and IDEAnet resource sharing products.

But IDEAdisk is just a piece of the whole IDEA story. We design and manufacture a full line of peripherals that are compatible with the IBM PC. And more importantly, compatible with each other.

Ask for IDEAdisk and the entire IDEA family of products at all Computer Depot, Math Box, Amerisource and Northeast Computer stores, plus selected Computerland, Inacom and MicroAge® locations. For the name of the IDEA store nearest you, call us toll-free at 800-257-5027.

See why the best IDEA in disk drives is the piece you've been missing for your PC.

How long is an idea?

With Revelation® by Cosmos, it won't matter. Our variable length structure lets you think long or short without worrying about needing disk space you can't afford. Think of it. Relational Data Base Management Software that saves up to 40% of your PC's disk space.

As a powerful, enhanced version of the PICK™ Operating System, Revelation uses plain English to create files, menus, entry screens, process information and generate reports. Plus, you can build,

customize and update your data base application without being an experienced programmer.

When you introduce your IBM® PC or compatible to Revelation, you'll see it change into a friendly brute that can communicate with other computers. Also featured is a hybrid full-structured programming language with an interactive debugging tool for serious development work.

Besides bringing the power, speed and flexibility of a minicomputer to your PC, Revelation works with

MS/DOS™ so you can use all the popular microcomputer software packages with the applications you develop.

Indeed, Revelation is easy to get along with. A veritable gentle giant. But, you need to know more before you decide to buy what may become your most valuable business tool. So call us at (206) 824-9942 and let us arrange for you to see what we've got here.

With Microfazer, you
could be doing this...

While your printer is
doing this.

Your personal computer works fast. Except when you're printing. Then it doesn't work at all. And when your computer's not working you're stuck waiting. But with Microfazer there's no more waiting. Microfazer is the print buffer that frees your computer. So you can compute and print at the same time.

Compute while you print
Microfazer stores data from your computer, then sends it to the printer at an appropriate speed. Because Microfazer remembers exactly what your printer

needs, you and the computer can get back to business fast. This makes Microfazer perfect for any buffer task: word processing, complicated graphics, you name it.

But Microfazer remembers more...

Microfazer remembers to give you the hardware features you're looking for in a print buffer. Features that include memory expansion to 512K.

(Parallel-to-Parallel version). RESET, PAUSE, and COPY functions. Plus a choice of serial or parallel interfaces (or combinations of both) for your data transmission requirements.

The perfect system buffer
Microfazer goes with printers and plotters to make it the perfect buffer for all your system needs.

And Microfazer's price makes it perfect, too.

So stop waiting on your printer. Get Microfazer and compute while you print. Microfazer. The buffer that remembers it all.

If you're looking for a quality monitor, look for this symbol.

**HX-12. A high resolution
monitor at a medium
resolution price.**

HX-12 is a high resolution RGB color monitor that's colorful enough for all your graphics needs and sharp enough for word processing.

With its own cable that plugs directly into the IBM PC, the HX-12 delivers a rainbow of 16 colors on a non-glare screen. All that includes clean whites without red bleed. In fact, all the colors are clean and crisp thanks to the HX-12's .31mm dot pitch and 690 x 240 (non-interlaced) resolution.

Shop around. Nothing else compares to the HX-12 priced at just \$695.

**The SR-12 delivers even
better resolution color for
a better-than-ever price.**

At first glance, the SR-12 might appear similar to the HX-12 with a non-glare screen and .31mm dot pitch supporting 690 horizontal resolution. But take a closer look. SR-12's scan frequency is 31.5 KHz, allowing the SR-12 to support 480 vertical resolution in non-interlaced mode. That means a high-quality, flickerless image with text that's up to monochrome standards. What's more, you get all that quality for \$799.

For full compatibility with all IBM software, get the **Princeton Scan Doubler**. Priced at \$249, it allows you to run the SR-12 from a standard IBM or IBM equivalent color card in the IBM PC.

You can't beat the SR-12 for resolution or price.

**MAX-12. You won't find a
better monochrome monitor for
a better price.**

PGS combines easy-on-the-eyes amber phosphor and exceptional 800 x 350 resolution to give you the MAX-12, the best monochrome monitor for your money.

Check the non-glare screen. Dynamic focusing circuitry keeps the image sharp, not only in the center, but around the edges and in the corners. Then check the price. At \$249 the MAX-12 is less expensive than the leading green-on-black competitor. And there's more. The MAX-12 works with the IBM PC and other IBM compatibles.

For clarity, performance and price, your choice is clear. Make it the new MAX-12.

FOX & GELLER SHIPS OZ!

ADVERTISEMENT

OZ DOES FOR MANAGERS WHAT SPREADSHEETS CAN'T

Elmwood Park, N.J.—Fox & Geller today announced the shipping of OZ, their new stand-alone financial management software.

OZ is designed to do what managers have been trying to do with spreadsheets all along.

OZ can work with spreadsheet files or its own data files to perform managerial functions like: Organizational consolidation, Profit & Loss analysis, 3-dimensional financial analysis, built-in financial reports plus complete color graphics capability. Most of these functions are performed with a single keystroke.

Fox & Geller boast of a unique Budget Variance Analysis feature in OZ. Everytime you change a number OZ will allow you to give a reason for making the change. This makes it easy to spot and explain any variance in your company's key financial in-

dicators. You could never do this with spreadsheets. In fact, many of the features in OZ have never before been available on microcomputers.

OZ is written in plain English with an instructive, step-by-step manual and requires no programming or previous computer experience.

Big corporations are seen as a major market for OZ as are current users of popular spreadsheet like Lotus 1-2-3™ Multiplan™ and VisiCalc™.

DEALERS EAGER FOR OZ!

Dealers today are spreading the news concerning OZ, the latest introduction from Fox & Geller, the creators of QUICKCODE.

OZ is a stand-alone financial management program specially tailored for managers. OZ enables the user to perform specific managerial tasks using data from OZ files or from existing spreadsheet data files.

Industry analysts predict the Fox & Geller name will guarantee OZ immediate success. "They are well respected," an industry spokesman said recently. "A lot of people are using their dBASE II enhancement packages," he said referring to QUICKCODE and dGRAPH by Fox & Geller.

OZ offers managers the ability to have complete control over their financials. OZ is the first and only software that can actually be used to

(continued on page 44)

These ads for OZ have appeared in major computer magazines including InfoWorld, Byte, PC Magazine, PC Week, Computer Retail News, Computer Merchandising, and Micro Market World.

ASK FOX & GELLER

Q: What is OZ?

A: OZ is a corporate financial management program that you can use by itself or as a companion to your existing spreadsheet. OZ is programmed to give you control over budgets, actuals and forecasts with a variety of easy to use functions.

Q: Why do I need OZ?

A: By controlling the financials of an organization you control the application. OZ gives you this ability. You will know why sales are down, why costs went up, what effect it will have on next year or the rest of this year and what can be done to control it in the future. Imagine, having this much information at your desk.

Q: How is OZ different than a spreadsheet?

A: As good as spreadsheets are, they are very general in their application. OZ was made for managers and is specifically tailored to perform functions managers need on a daily basis.

OZ does what managers have been trying to do with spreadsheets all along. Managerial functions like computer-aided variance analysis, updating and maintaining P&L, organization consolidations, budget forecast and actuals, 3-dimensional financial analysis, built-in reports of key financial indicators and complete color graphic capability to name a few.

Q: Do I have to be a Fortune 500 company to use OZ?

A: No. OZ is as useful for managers in small and medium size businesses as it is for the middle managers in large corporations. OZ is for anyone who wants complete financial information regarding all aspects of their business.

Q: Where do I get OZ?

A: OZ is available at most local computer stores. Or call Fox & Geller directly at

In the Hard Disk Jungle Tallgrass Clears A Path

In today's hard disk jungle, Tallgrass clears a path by offering high performance, integrated mass storage solutions for the IBM® PC/XT, the T.I. Professional and related computers.

TALLGRASS INNOVATIVE FEATURES

MASS STORAGE SYSTEMS with formatted HardFile™ capacities of 6, 12, 20, 35 and 70 Mb, all with built-in tape backup.

CONVENIENT INTEGRAL TAPE BACKUP SYSTEM allows rapid tape "image" streaming, or incremental file-by-file backup and restore on ANSI standard inexpensive data cartridges, instead of the usual floppies, video cassettes, or low-capacity removable Winchester devices.

NETWORK READY and fully compatible with networks such as PCnet® and EtherShare™

HIGH RELIABILITY with dual directory and read-after-write verify options. A dedicated landing zone, where the read/write heads reside when the disk is idle, provides data protection during powerdowns and transportation.

Follow the Tallgrass path to your local computer dealer and watch your personal computer transform into a powerful data processing system.

Available from COMPUTERLAND® Entré® Computer Centers, MicroAge® Computer Stores and other participating computer dealers.

We thought about calling it MacSimplex . . . after all it makes your IBM®PC behave like a Macintosh™ and much more . . .

and with over two years in the making, the Simplex Database Management System has features like 32-megabyte virtual memory and the most powerful networked/relational database in the microcomputer industry. Simplex was designed around how you think and the Macintosh way, so that you can use your favorite mouse to handle those mundane tasks like menu selection and data manipulation. And, if you don't have a mouse, you can use our keyboard mouse simulator, MouSim™.

Pop-up and pull-down menus, dialog and alert boxes are not just added features, they are the heart of the Simplex way. In addition, Simplex gives you both a software and a hardware floating point capability, each with 19-digit accuracy. It permits login, password, privilege, and can be used on a local area network. Simplex has full communications and a remote or local printer spooler. Above all, Simplex is modular and grows with you! Simplex also has a full-featured, English-like language which is simple to use.

You can't buy Simplex™, but it is now available as an integral part of
it's my **Business**™ and will be used by it's my **Word**™, it's my **Graphics**™, . . .

Businessmen! it's my **Business** will revolutionize the way that you handle your business. It saves time, money, and standardizes your system for all who use it. it's my **Business** comes with applications like accounting, interoffice or intraoffice mail, editing, invoicing, inventory management, mail list, calendar, scheduler, forms and more. You can modify each of these to create applications specifically designed for you... maybe we should have called it "it's your Business".

Professionals! it's my **Business** has over 200 pages of examples and demonstrations to show you how to solve your everyday professional problems. And if these examples aren't enough, we give you a complimentary one-year subscription to Qwestalk™, our hands-on Simplex applications magazine.

System integrators and consultants, beware! If you are not using it's my **Business** with Simplex to solve your problems, don't be surprised when more novice programmers solve that complex math, industrial engineering, or business problem faster. We think that you can cut your concept-to-development time by an order of magnitude!

it's my **Business** (includes it's my **Editor**) - \$695.00
it's my **Business** Demo Disk - \$20.00
it's my **Editor** - \$100.00.

Sensible Solution™ software from O'Hanlon separates the business tools from the toys!

Finally, a computer language you can understand, and accounting software applications you can really use in your business. The SENSIBLE SOLUTION™ is not just another "file handler", it is not a toy, it's a brand new computer language. With it, you can modify any of the ready-to-run accounting applications from O'Hanlon to better fit the personality

of you and your business.

You see,
everyone
runs their

business just a little bit different. That's why there is a SENSIBLE SOLUTION™ in the first place.

My wife Tova, is president of the TOVA 9 Corporation. Hundreds of people call TOVA 9 everyday to order her secret beauty formulas. The SENSIBLE SOLUTION™ can help Tova record and track those sales, control her inventory, and handle her payroll. SENSIBLE knows exactly who and where Tova's customers are and remembers what they like.

Even if you've never used a computer before, you can be programming with The SENSIBLE SOLUTION™ right away. It speaks in English, and you don't have to

remember a long list of commands. The SENSIBLE SOLUTION™ isn't just user friendly, it's downright sociable! Available at computer dealer stores near you!

Integrated.

Printegrated.

Now, translate your integrated software into integrated hard copy, with the TI OMNI 800™ Model 855 printer. So versatile, it combines letter-quality print, draft-quality print and graphics as no other printer can. It prints letter-quality twice as fast as comparably priced daisy wheel printers, yet gives you characters just as sharp, just as clear.

It prints rough drafts ten times faster than daisy wheel printers... faster than most any other dot matrix printer. Only the TI 855 has snap-in font modules. Just touch a button; change your typestyle. The 855 gives you more typestyles to choose from than ordinary dot matrix printers. It makes them quicker, cleaner, easier

to access than any other dot matrix or daisy wheel printer.

The 855's pie charts are rounder... all its graphics are sharper than on other dot matrix printers, because the TI 855 prints more dots per inch. As for daisy wheel printers... no graphics.

The TI 855 Printer

The printer for all major PC's

For under \$1,000 you get twice the performance of typical dot matrix printers. Or all the performance of a daisy wheel printer, and then some, for half the price.

So get the best of all printers, and get optimum results from your integrated software. With the TI 855. See it at your nearest authorized TI dealer. Or call toll-free: 1-800-527-3500. Or write Texas Instruments Incorporated, P.O. Box 402430, Dept. DPF-181PM, Dallas, Texas 75240.

NCC: Where's the Story?

Even PC-related vendors resort to me-too products and marketing hype at show

BY BILL MACHRONE

LAS VEGAS—Perhaps it will go down in the annals of history as The Show Where Nothing Big Happened.

It was a sad state of affairs at the National Computer Conference (NCC), at least for news-hungry journalists.

Take compatibles. Almost since their inception, the com-

patibles manufacturers have taken an uneasy "us vs. IBM" stance. Columbia, firmly ensconced in third place with solid, workmanlike machines, has no hope of overtaking runaway Compaq. So what does Columbia do at NCC?

Throws rocks at Compaq's just-announced Deskpro in a

head-to-head comparison with its Professional.

Compaq had been playing it cagey about the source of the Deskpro's tape drive for two reasons. First, it didn't want to have to compete with other compatible manufacturers for this single-sourced product. Also, Compaq wanted a suffi-

cient lead time during which its machine would be the only one so equipped. To further its cause, the company implied to the press that the unnamed manufacturer was building the drive with proprietary, Compaq-developed technology.

Meanwhile, the drive man-

Compatibles Seek Niches With Price, Speed, Savvy

New machines from Tava, ACT, and Polo court customers in the crowded compatible market

BY CONNIE WINKLER

NEW YORK—The craziness continues.

While some segments of the IBM PC and compatible market are falling down, and others are reconsidering the future of MS-DOS anyway, yet others are still in the compatible frenzy.

• Tava Corporation, which already offered a bargain-basement PC, now has a \$2,495 Turbo Tava that runs at 8 MHz (or at the standard PC's 4.77 MHz). The Turbo Tava is based on the Intel 8088-2 chip and has a hard disk expansion slot. And, the original Tava PC price has been cut further to \$1,955.

• ACT, the British PC leader,

is taking two swings at the United States market with its Portable (built-in 80-by-25 line LCD screen, Sony 3½-inch drives) with voice input and its

\$1,595, compact desktop FI with a cordless, infrared track-ball mouse (no need for a clear desk), up to 720K RAM, color graphics, and bundled software.

• Polo Microsystems is moving ahead nicely (thank you) with a Hong Kong-manufactured \$3,995 everything-you-always-wanted PC and software bundle for businesses requiring fewer than five PCs. The Polo is aimed at vertical markets such as florists, veterinarians, and cemetery managers.

Certainly none of these three companies will perturb IBM, the newly ambitious AT&T, or even Compaq Computer, which are gathering steam in the Fortune 5000 market. Each, however, has found an interesting

(continued)

ACT includes infra-red keyboard and 3½-inch disk technologies in its Apricot FI (left) and Portable (right).

Compatible Niches (continued) niche: ACT continues to rub out IBM in Europe. Tava still wins on price, and Polo is making interesting plays in small still-to-be-penetrated niche markets.

Tava Tactics

Tava has been selling 500 PCs a week with its \$2,395 model that has now been cut to \$1,995. That sales number will jump to 1,000 when the Turbo Tava is available after August, said Tava president Perry Lambda. Business users, especially, will want the 8 MHz speed offered on the

color adapter, and green or amber screen monitor.

Immediately after IBM's June PC price cuts (in the neighborhood of 23 percent), Tava experienced a slowdown in sales, but a spokeswoman attributed that to an "emotional sort of reaction," which has subsided.

ACT into U.S.

Going into production in August (in the U.K.), the ACT Apricot Portable weighs in at 13 pounds and has a detachable keyboard capable of remote, infrared operation, like the PCjr.

Turbo, he believes, although the machine doesn't come with a hard disk. (A hard disk version is expected later this summer.)

The 1½-year old Tava—which is committed to undercutting the price of IBM's PC and others while still remaining compatible—is also planning machines based on the new Intel 80186 and 80286 microprocessors. Lambda said.

Based on the Intel 8088-2, the Turbo Tava comes standard with five expansion slots, 64K expandable to 256K on the motherboard and a system total of 640K (\$60 for each additional 64K of internal memory), parallel printer port, RS-232 port, two 360K disk drives, and a monochrome monitor and controller.

There's also room in the Turbo package for a 10- to 30-megabyte hard disk and an XT compatible power supply. The Turbo will go to dealers in August, Lambda said.

The Tava-PC now has 64K memory (versus 128K in an earlier edition), two 360K floppies, controller, monochrome or

The weirdly shaped system unit, with a voice input microphone on one side, has a tilted LCD screen and 3½-inch drives on the side of the lower unit.

At \$2,695—with 256K RAM and a lone 720K Sony double-sided disk drive—the Portable is intended for out-of-the-office use, at home or traveling, said Peter Davies, president of ACT (North America) Inc. For the office, ACT recommends a color monitor and the cordless mouse for about \$500 more.

Although voice input was not operating on the prototype shown at PC Magazine offices recently, ACT promises the machine will accept 64 single-word voice commands.

Both the ACT Portable and FI are based on the Intel 8086 (at 5 MHz, about 30 percent faster than the IBM PC); they come with built-in word processing, calendar, and SuperCalc spreadsheet software. These computers will run most MS-DOS programs, ACT said, despite their use of smaller disks.

The bargain-priced FI is

aimed at the education market and supports 640-by-256 pixel graphics. Its infrared, two-button trackerball mouse is optional. Users rotate the ball directly to produce the same effects as moving a mouse cursor controller (such as Micro-soft's) around on a desktop. A fiber optic "light pipe" (similar to the one available for the detachable keyboard) is available for use in busy environments.

ACT products are being distributed here through Micro D distributors and their 300 dealers, said Davies.

Polo's Game

"It depends on where you're starting from," comments Robert J. Sherwood, on recent slowdowns in PC sales and the survival woes of compatible-makers. "If you're used to 40 percent growth rates, then today it's slower." Sherwood doesn't have that problem because he's starting from zero. "From where we are, if there's a softening in the market, we don't see it," said the vice president of marketing for the Mountain View, California-based Polo.

Polo's secret is that it is truly an all-in-one, prepackaged system for the user who wants fewer than five computers and no hassles. This isn't the market AT&T and IBM are courting, quips Sherwood.

Polo comes with a built-in 300-baud modem, 120 cps correspondence-quality printer, color monitor, detachable keyboard, and, of course, the standard 128K memory, dual floppies, and all the necessary cables. The full software bundle is special in that it includes *Crosstalk* for communications, as well as *SuperWriter*, *SuperCalc 3*, *PFS:File* and *PFS:Report*, and *Finance Manager*.

Polo is marketed by value-added retailers (VARs): retailers who do more than 50 percent of their business through outside sales staffs that are willing to call on a company that needs no more than five PCs, Sherwood explained.

Polo's hardware is manufactured in Hong Kong by the Radofin company, then warehoused in Sunnyvale, Calif. ■

Will MS-DOS Follow CP/M Into Oblivion?

LAS VEGAS—How long will the "PC standard"—the popular designation for an MS-DOS operating system running on an Intel 8088 processor—survive?

Experts at the National Computer Conference (NCC) here recently suggested MS-DOS may well follow the way of CP/M, which on many machines is now obsolete. What system might dominate next?

● Esther Dyson, president of E!Ventures: "IBM thinks it owns PC-DOS, but it doesn't. There's going to be a huge market out there for PC-DOS hardware and software, no matter what IBM does."

The New York publisher of the *RELEASE 1.0* micro software newsletter acknowledged that IBM in its DOS hasn't addressed icons for user interfaces or "appreciated the advantages of a nonintimidating user interface or the importance of integrating graphics within text."

● Aaron Goldberg, director of microcomputer services for International Data Corp. in Framingham, Massachusetts: "The 8088 is not the way to get things done. Too many programs are slow to load, and it's not capable of multitasking." Predicts Goldberg: "At least 10 to 12 compatible manufacturers will die."

● John F. Akers, IBM president, also tiptoed around the issue of alternative operating systems. Asked if IBM would adopt UNIX on its next generation of microcomputers, Akers responded (as he has on other occasions), "if a particular operating system appears to have the support of most of the marketplace, then we would seriously consider offering that product to our customers." ■

NCC (continued)

ufactor, Irwin Magnetics, has been showing the drive to OEMs, lining up orders for as much business as possible.

Compaq's reaction was outrage. It quickly claimed that it had already committed to buy Irwin's full output for the foreseeable future and that no one else was going to get any of the

TeleVideo moves towards PC networks with its Personal Mini file server.

tape drives. Columbia countered that in October it will be shipping the drives in quantity as part of the Columbia.

Ironically, Columbia's ad conveniently overlooks one point in its point-by-point comparison with Deskpro: The Deskpro is two to three times faster than the Professional. Decisive? No, just marketing.

AT&T Anticipation

Just prior to the show, a rumor cropped up that MS-DOS would not be the primary operating system for AT&T's new PC 6300. Instead, Concurrent PC-DOS, by Digital Research Inc., would be the standard. On the second day of the show, AT&T Information Systems and Digital Research (DRI) scheduled a joint press announcement. Everyone was poised for a potentially strong statement about the direction of operating systems on personal computers.

Instead, they got assurances. Yes, DRI's Concurrent PC-DOS would be offered on the PC 6300, but so would Microsoft's MS-DOS. No one would be specific about anything. Officials at AT&T said that Concurrent PC-DOS was conceptually a lot closer to UNIX than MS-DOS, a natural preference for its existing UNIX customers. Asked if Concurrent PC-DOS was a hedge against IBM's anticipated windowing product going under the name Glass, an AT&T press represen-

tative responded, "What if Crystal [DRI's windowing product] is Glass? Reflect on that."

Cute. The last thing we need now is for the world's largest company to play cute.

TeleVideo Mini

Meanwhile, TeleVideo Systems announced that its Personal Mini (PM) network server was ready for shipment. The product, which was previewed at Spring COMDEX, provides low-cost file sharing and networking for PCs and compatibles, including TeleVideo's diskless PM Workstation. The adapter card for PCs is only \$99, instead of the typical \$600 for a network card.

TeleVideo calls the operating system InfoShare. The networking software is actually Novell's highly regarded *Netware*, which permits file sharing, multiple access, and record locking.

Tecmar thinks big with its 74-megabyte drive and 45 megabyte tape back-up.

Inside the diminutive box, file operations and MS-DOS emulation are handled by an 80186 running at 8 MHz. Each PC channel is managed by a Z-80 microprocessor over a high-speed, twisted-pair cable. A 46-megabyte drive provides storage for up to 16 users. Back-up is via a built-in 700K floppy or optional tape; 256K of standard memory can be expanded to 512K for better performance with a larger number of users.

The PM/16 drives both serial and parallel printers, allowing users to share expensive resources such as high-speed or

letter-quality printers. The PM/16 is \$8,995, including the InfoShare operating system.

Tecmar's Big Drive

Tecmar also had a quiet contribution to the networking scene, in the form of its new Massfile storage unit. The unit is the first to feature a truly high-performance 5¼-inch hard disk, manufactured by PRIAM Corporation. The 74-megabyte drive is backed up by a 45-megabyte tape unit.

The Massfile attaches to any PC via a standard Tecmar hard disk controller card. While a single user could use the system, its more likely application will be as an add-on to a PC working as a file server on a network. The PRIAM drive features average access times less than half those of hard disks typically used on PCs. The increase in performance is obvious, even to a casual observer. A virtually identical version of the product was announced simultaneously for the Apple Lisa, a machine that sorely needs high-performance disk I/O.

Also shown at the Tecmar booth was *PC Paintbrush*, a Macintosh-like color screen-painting program to be offered free with Tecmar's Graphics Master board.

Trial software packages were everywhere at NCC. Transend Corporation broke all previous price barriers by offering a trial version of its *PC Com-plete!* package for only 99 cents. Unlike other trial packages that leave out some vital function, this one has them all. However, it counts the number of times that you use it and quits after 15. Transend sweetens the deal for retailers with a point-of-purchase display and even rental models if the prospective customer doesn't have one. *PC Com-plete!* offers a comprehensive list of features, including untended electronic mail and effective screens that simulate in and out baskets.

The realities of the marketplace have also caused some attractive pairings of large and small companies. One of the nicest is AT&T Information Systems' association with Relational Data Systems (RDS),

Columbia vs. Compaq

In the latest battle of the IBM-compatible giants, Columbia is the clear value winner.

Both Columbia and Compaq have recently introduced their latest technologies in hard disk, network tape back-up, and other capabilities. We would argue that this would be about the same quality level. But, does one or the other have more value?

Here, the Columbia 6300 (PC-DOS 3.0), and the Compaq 6300 (MS-DOS 3.0) are compared. Both have a color graphics controller, a parallel printer port, and a serial communications port.

Mr. ChipsTM Plays Your PC Like a One Man Band

Mr. Chips, the new multi-function card from Orange Micro, adds a full ensemble of features to your IBM[®] PC. Memory, printer ports, and a clock are standard, and you'd expect them on a top quality board. But computing is changing.

Soon computers will take care of everyday things; like watering the lawn, or turning on your lights when it gets dark. And only Mr. Chips can do this now. These capabilities are standard, so your growing needs won't require additional equipment. There's also a dual game port, so you can duel to the end, by yourself or with a friend.

Every Mr. Chips comes with Chipdisk[™] software, for RAM disk and print spooling. With RAM disk you set up your PC's memory to act like a disk drive. This means much faster execution and searching of programs. Print spooling sets your PC's RAM to serve as a printer buffer, so you can compute even while your printer is printing.

You can orchestrate all this power

for a remarkably low price. Visit your dealer and see for yourself: Mr. Chips is the multi-function card for today...and tomorrow.

The First Multi-function Card with 9 Standard Features

- **Parallel Port[®]:** Great for getting fast printouts on efficient dot matrix printers.
- **Serial Port:** The most popular way to access high grade letter quality printers or phone modem communications.
- **64K-256K RAM:** Upgrade your PC's memory to handle powerful integrated software and other larger programs.
- **Clock/Calendar:** Accurately keep track of time and date, even when your computer is turned off.
- **Dual Game Port[®]:** Accommodate two complete joysticks at once, so you can play alone or duel with a friend. Also for use with CAD/CAM software.
- **Real World Interface:** This innovative port can monitor and control equipment like thermostats, moisture detectors, photocells and other independent devices.

- **BSR[™] AC Line Controller[®]:** Control your lights, appliances, security systems, or anything that plugs into an AC wall socket.
- **Chipdisk RAM Disk:** Set your PC memory to act like a disk drive. Your programs will run much faster than with conventional disk drives.
- **Chipdisk Print Spooler:** Your PC memory will serve as a printer buffer, so you won't have to wait for your printer anymore.

Tables

Title Pages

SIGN-MASTER is the first program designed to allow everyone from top management on down to produce colorful, attention-gaining "word charts" and tables for presentations and reports.

Created on a PC with a compatible plotter or printer, SIGN-MASTER word charts are superior in quality to typing and less expensive than typesetting or printing.

Professional Word Charts Made Easy

In just minutes, this unique menu-driven program lets you create impressive, easy-to-read documents using words, numbers, lines and SIGN-MASTER's simple-to-master Table Mode.

Number 1 in Quality Text

SIGN-MASTER offers the greatest variety of text options. In addition to 6 fonts, 16 sizes and 8 colors, you can justify text, underline, italicize, set margins, spacing, and more.

An Important Presentation Tool

With SIGN-MASTER and any one of over 40

plotters, you can produce full color originals on paper and overheads. The program also works with over 10 printers to create the highest quality printer graphics available.

Make Super Slides Quickly and Economically

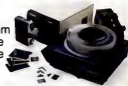

Presentation-quality 35mm slides can be created in-house and inexpensively using the Polaroid Palette in conjunction with SIGN-MASTER.

For reports and presentations that get noticed, get SIGN-MASTER — Number 1 in word charts.

Artificial Intelligence Comes of Age on PC

Teknowledge, Inc., with \$12,000 M.I. offers a PC-based 'instrument panel' for developing knowledge-based applications

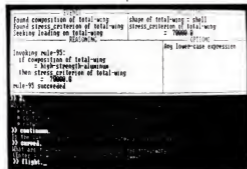

BY ROBIN WEBSTER

PALO ALTO—What wine should I have with herbed chicken livers? Is my current portfolio working in the best way for my capital? At what point will the building I just designed fall over?

Such questions are generally

blown knowledge-based systems.

M.I. was developed by the Palo Alto-based Teknowledge company, a spinoff of Stanford University that employs many leading artificial intelligence (AI) experts.

handled by wine, financial investment, and structural engineering experts—of the human kind. Now with an "expert system" package called M.I., IBM PC users can now explore the possibilities of using their machines to deal with these and other more sophisticated problems.

Intelligence Now?

The introduction of M.I. does not mean that expert systems for microcomputers have "arrived." Its hefty \$12,000 price tag (including a 4-day training course) puts the package beyond the range of most individual IBM PC owners. It will, therefore, be mainly of interest to corporations with enough problems to make such a purchase worthwhile. Even then, M.I. is still only a prototyping system—it cannot be used to create full-

What Is AI?

A knowledge-based system is comprised of two parts: a collection of facts and rules about a specific area of expertise (the *knowledge base*), and a logic system that uses those facts and rules to make inferences based on user input (the *inference engine*). Additionally, well-designed knowledge systems allow the user to interrogate the knowledge base to discover how certain conclusions were made.

Not long ago, knowledge-based systems existed only on mainframe and larger minicomputers, or on custom machines that were optimized to run huge LISP programs at phenomenal speeds. Developing and operating such sophisticated systems typically cost somewhere in the six-figure range, and they were usually dedicated to solving problems in a single domain (di-

agnosing meningitis or prospecting for particular metallic ores, for example).

Although its price tag might suggest the need for a large amount of main memory, the M.I. system can operate in only 128K of RAM. It was written mainly in the PROLOG (PROgramming in LOGic) language. Any knowledge system de-

tural engineering expert system developed at Stanford on large computers.

In addition to dealing with expressions couched in an English-like manner (as in the SACON example), M.I. can handle mathematical expressions such as $(132 * 100)/12$ or Integral $(2 * x / (\log(x) - 1))$.

Q and A Sessions

M.I. has almost no user interface to speak of since it merely plays out consultation sessions in question-and-answer form. The system asks the necessary questions and the user responds as accurately as possible. Questions are displayed in dark blue (if you have a color system) and answers appear in light blue. This color choice, in common with all other user interface arrangements, cannot be changed.

A new idea that M.I. has

if a substructure of the house = X1
and the composition of X1 = cast-iron
or the composition of X1 = concrete
and a stress on X1 = X2
and X2 > 50
then a risk to the house = cracking of 60

Figure 1: A knowledge rule taken from the SACON structural engineering system, a compact version of which is supplied with M.I.

veloped with M.I. can access up to 200 knowledge-based rules at one time.

How It Works

A knowledge rule might take the form of an IF-THEN statement, as shown in Figure 1. Notice that variables are allowed, and that the "risk" involved in a situation is given a certainty factor (cf) rating. The cf feature is an important mechanism for encoding judgments, or even hunches, about how a particular problem should be tackled in a machine-acceptable form.

Most of the rules are examples of common sense: if it is raining outside, then there is a very high probability you will get wet if you go for a walk; if you take an umbrella with you, the likelihood of getting wet diminishes.

One such set of rules is SACON (short for Structural Analysis Consultant), a struc-

brought to knowledge-system development on microcomputers is that of the "instrument panel." This panel is used by the knowledge system builder to test and debug an application. Data, including the current rule or expression being evaluated and the current knowledge-base rule being invoked, is displayed within the panel. This allows the designer to spot flaws in the reasoning method of an application while it is actually functioning.

Although M.I. is Teknowledge's first commercial test of the "knowledge system on a micro" concept, the company already plans to introduce more developed knowledge-based products in the near future. One product, T.I., is intended as an educational tool. Another will be a full-fledged expert system builder package based on M.I.

Teknowledge, Inc., 525 University Ave., Suite 200, Palo Alto, CA 94301, (415) 327-6600.

Calling Micro Mart™ Can Be Music To Your Ears

We are a multi-million dollar production, orchestrating your favorite PC hardware and software at superb discounts—all accompanied by great service and technical support.

Find out what our biggest critics (our Fortune 500 accounts) already know. Our selection is above measure. Each of our consultants are virtuosos in personal productivity and our discount savings will tickle your ivories.

We're playing your tune in the heart of distribution, not just fiddling about "the Old Mill Stream." So check out the score of state-of-the-art PC products in the rear of this magazine and give us a ring. Ask for expert advice and your best price.

On the Road with IBM: Vive la Différence à l'Expo

BY STEPHEN MANES

PARIS—In the shadow of the Eiffel Tower's technological wizardry, the Trocadero Gardens of Paris get one star from *Guide Michelin* for their surging fountains and broad-leaved trees. What better place to launch an exhibit with the theme of applying technology to the facts of nature?

Voilà! Under the spreading chestnut trees appears a bright, airy, plexiglass-and-wood quonset hut designed by Renzo Piano, a chief architect of Paris's controversial Pompidou Center. Inside is *l'Expo*, an IBM Corp. exhibit that will travel to 20 cities in 14 European countries over the next 3 years. Aimed at 15- to 24-year olds, the show struts IBM's stuff with a strong emphasis on applications.

"At *l'Expo*, the personal computer is king," declares one of the exhibit's lavish brochures. PCs and XT's (plus one lone Junior) are strewn about the hall, where they play interactive games, decipher voice commands, serve as videotex terminals, and generally do the things they do with great aplomb. But to those who've seen all that before, the real reality of the show

is its hands-on glimpse into the past and future of computers.

One exhibit takes a look at the development of a chip (called a *puce*, the French word for "flea" or "tiddlywink") from raw silicon to integrated circuit. Visitors are allowed to peer through a microscope at IBM's first mass-produced 64K memory chip, dating from the "historic" days of 1978. Also on display are the high-density, water-cooled panels that go into IBM's top-of-the-line mainframes, plus Model 3380 disk drives with on-line storage of 2.5 gigabytes and access to 3 megabytes per second.

Super Screens

Model 3290 gas plasma screens, with their peculiar high-resolution orange glow, which IBM has been quietly unveiling over the last several years, are almost as plentiful as PCs at *l'Expo*. Even more stunning are the highly realistic, 256-color floral images displayed on the Model 5080. And a Model 7350's demonstration of image enhancement lets you zoom in close on an aerial view of Paris.

Demonstrations of voice in-

put include a particularly impressive experimental program designed to "visualize" sound and help deaf children learn to speak more clearly. Various graphics tablets let visitors modify images and add captions to droll cartoons. Touch screens and icons have appeared in U.S. exhibits, but if IBM Europe has secret plans to join the Xerox Star and Apple Mac/Lisa bandwagon, it keeps them well hidden at *l'Expo*: not a single mouse is in evidence.

Esoteric hardware, on the other hand, is all over the place. The Model 4250 photocomposer is there, setting reproduction-quality type and illustrations on aluminum paper. A Model 7535 industrial robot grasps U.S. Olympic coins and slugs in its spidery fingers and, under the guidance of a PC, puts them through a series of tests to distinguish the genuine from the fake.

Lasers get their due in the form of glass-slicing tools and holographic supermarket scanners. And a film from Big Blue's Zurich labs puts you closer than ever to the submolecular world with the help of a computer-

enhanced "tunnel effect" microscope that is able to take three-dimensional views with a vertical resolution of approximately one atom—almost 500 times better than previous limits.

Though *l'Expo* is hardware heaven, the show brochures are also notable, especially in contrast to IBM's dry U.S. brochures. One brochure, attempting to show how reality can be represented by a network of relationships among facts, uses such disparate concepts and personalities as infinity, death, Yuri Gagarin, Phäethon, and Teotihuacan to come up with a working definition of the sun.

In the master brochure, along with results of a poll of European youth (significantly more are interested in sports, arts, and leisure than in science), is the most surprising image of the whole show: a photo of Elvis Presley juxtaposed with album covers of the Beatles' *Rubber Soul* and the Nina Hagen Band illustrating an article, "Music and the Young: 25 Years of Rage, Myths, Fashions."

What's remarkable about this piece is that it must be the first official IBM document that recognizes the existence of Frank Zappa, Lou Reed, the Velvet Underground, the Clash, and—may God save the Queen—the Sex Pistols. So the most important question about technology and nature that *l'Expo* raises may well be this: Will the PC/jr be marketed overseas as a punk computer? ■

Western Union's EasyLink Taps Into Tymnet

UPPER SADDLE RIVER, N.J.—Western Union's EasyLink electronic mail service is now only a local call away in more than 450 cities, thanks to Tymnet.

When the EasyLink service was first offered, there were 16 "Metropolitan Area Connect Numbers," which were part of Western Union's own packet-switching network; subscribers outside of these areas used a toll-free number.

While the announcement to

subscribers didn't mention Tymnet by name, Western Union now uses this national packet-switching network to provide additional access to EasyLink. The changes come after the U.S. Postal Service has cut back its electronic mail service.

Give and Take

Perhaps the best news is that there is no additional charge for using these local numbers. As before, Western Union charges only for sending messages, not for receiving them. The charges are based on time, and vary depending on the baud rate used, with discounts for off-peak and volume usage.

The "give" in the announcement is tempered with a little "take," however. One of the company's reasons for adding the Tymnet connections was the high cost of the toll-free service, according to a Western Union spokesperson. As a result, it has added a 15-cents-per-minute surcharge for connection to the toll-free number, effective in August. Also, any EasyLink message that has been left in a subscriber's "mailbox" more than 10 days will be delivered as a Mailgram Message, with a 50-cent charge to the recipient. This guarantees any message sent will eventually be delivered, even if recipients forget to check

their EasyLink mailboxes.

Nearly half of the 60,000 EasyLink subscribers use microcomputers to hook in, and the percentage is growing rapidly.

Western Union also has aggressive plans to release a microcomputer communications program to simplify creating your messages off-line and to completely control dialing EasyLink, signing on, sending the message, and signing off. The program, due late this summer, also accesses other on-line services, and is expected to be just the first of many new products and features scheduled for the next 6 months. Western Union said. ■

Something Totally New in Applications Software From Borland,
The Folks Who Make Turbo Pascal.®

SIDEKICK

ALWAYS
JUST A KEYSTROKE AWAY...

"SOMETHING TO RELIEVE
THIS MESS!"

If you've ever found yourself searching for a calculator or a notepad when you've got a computer right in front of you, then you know why we came up with Sidekick®.

WHETHER YOU'RE RUNNING
1-2-3, WORDSTAR,
dBASEIII OR WHATEVER...

JUST A KEYSTROKE
AND A SIDEKICK
WINDOW OPENS...

- A CALCULATOR
- A NOTEPAD
- AN APPOINTMENT
CALENDAR
- AN AUTO DIALER
- AN ASCII TABLE
- AND MUCH MORE

ALL AT ONCE... OR ONE AT
A TIME. ANYWHERE ON
THE SCREEN YOU LIKE.
ANOTHER KEYSTROKE,
AND YOU'RE RIGHT
WHERE YOU LEFT OFF
IN YOUR ORIGINAL
PROGRAM!
(you never really left!)

Something brand new. Crafted in Assembly language as carefully as Borland's famous Turbo Pascal®, so that it's lightning-fast and as compact as only Borland knows how to make it! With a notepad that has a full-screen editor that saves your notes to disk. You can even swap information back and forth between your applications software and your Sidekick®.

Suppose you're working with a spreadsheet, and you suddenly have an important idea. Just hit the button, a window opens, you write the note and hit the button again. You're right back where you left off in the spreadsheet.

SIDEKICK

INTRODUCTORY OFFER

\$49.95

Available only for the IBM PC, XT, and compatibles

Need to make a phone call? Whether the number is in an existing database, your own Sidekick phone directory, or you've just typed it on the screen... put the cursor next to the number, hit the keystroke, and Sidekick dials for you!*

There's lots more, too. You can move the Sidekick windows anywhere on the screen you like. And you can have as many on screen at a time as you need.

We designed it because we needed it. If you've ever been writing a report and needed to do a quick calculation, or jot down a note, then you understand why.

*Only with Hayes Smartmodem and compatibles.

YOU CAN ORDER YOUR COPY OF SIDEKICK® TODAY!

Get yourself a

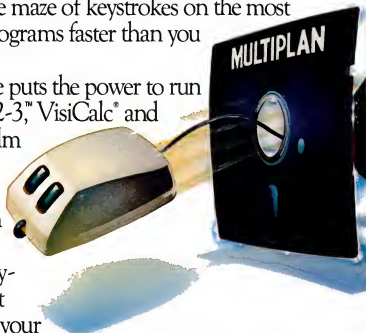

This little critter comes with specially-designed software that flies through the maze of keystrokes on the most popular business programs faster than you can say "cheese."

Microsoft® Mouse puts the power to run Multiplan®, Lotus 1-2-3®, VisiCalc® and WordStar® in the palm of your hand. Click the left button on the mouse, a custom menu appears. In English, not hieroglyphics. Click the right button and execute your command: move text or data, edit, format, print. All at blinding speed without touching the keyboard.

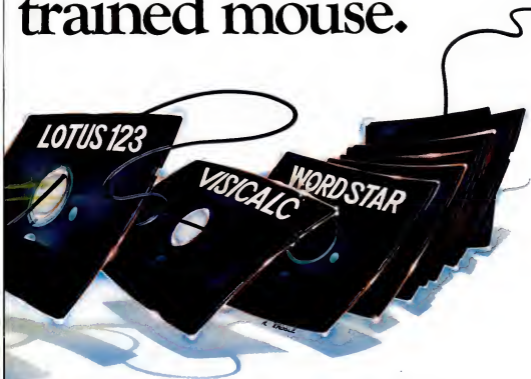

It also lets you create your own menus for editing and formatting existing application programs. So people can learn programs quicker and do more productive work as they learn.

The mightiest mouse.

Microsoft Mouse runs circles around other mice. It is the high performance mouse for the IBM® PC and PC XT. From the company known for high

trained mouse.

performance software. Microsoft BASIC is the language spoken by nine out of ten microcomputers worldwide.

MICROSOFT. Our MS™ DOS operating system tells
The High Performance Software your IBM PC how to think.

So don't monkey around with any other mouse. Call 800-426-9400 (in Washington State call 206-828-8088) for the name of your nearest Microsoft dealer. Then go with Microsoft Mouse. The mouse that soars.

WHAT WOULD YOUR CUSTOMERS SAY TO A MULTIFUNCTION MONOCHROME CARD?

I'LL TAKE ONE PLEASE.

When your customers need a monochrome adapter card for the IBM PC/XT, make sure they get something special: Quadvue by Quadram. The monochrome adapter card packed with four additional hardware functions and special applications software, too.

A Monochrome Card... Plus

Snap Quadvue into the PC to drive any standard monochrome monitor. Then take advantage of Quadvue's extra features for expanded capabilities.

Quadvue comes with a parallel printer port, a serial port for connecting modems, plotters, and other serial devices (plus, there's room for adding a second optional serial port whenever you want), and a battery powered chronograph.

Complete Software, too

Quadvue comes with complete software, too. Featuring three special soft fonts that let your customers choose from a selection of character sets. There's even software to create your own personalized font styles.

Plus, there's complete diagnostic routines to test each of the Quadvue's functions. For trouble-free trouble-shooting.

Quadram delivers

Quadram gives your customers everything they're looking for in a monochrome card. Including a full one-year limited warranty, complete technical support, and the continuing tradition of Quadram Quality.

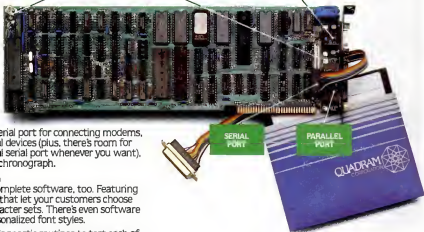

Picture it for yourself in your own store. Then watch how fast your customers make them disappear.

SIMPLIFIED SPREADSHEET ASSEMBLY

RISING SPREADSHEET (A) KNOCKS MEXICAN JUMPING BEANS (B) INTO MOUTH OF NEUROTIC MAN (C) WHO IS SO DISCOMBOLATED THAT HIS HAIR STANDS ON END, DISLUPPING HAT (D) WHICH OPENS CAGE (E) AND RELEASES EPICUREAN MOUSE (F).

MOUSE, INSPIRED BY SCENT OF PERFECTLY AGED CAMEMBERT CHEESE, GRABS THROUGH SPREADSHEET, ONLY TO DISCOVER IT HAS BEEN FOOLED BY AROMA OF OVER-RIPED GORGONZOLA (G).

IN A FIT OF PIQUE HE SPILLS VINTAGE WINE (H) INTO WRITER'S WHEEL (I) WHICH TURNS PULLEY THAT CAUSES GLOVE (J) TO GRASP SPREADSHEET AND MOVE IT TO TAPING AREA.

SHEET IS TAPED SECURELY IN PLACE BY TRAINED ADHESIVE TAPE WORK (K).

MADE SIMPLE.

Now you can save time, aggravation, adhesive tape, and Gorgonzola cheese by following one simple direction—Sideways. It's the unique software program that lets you output all the spreadsheet columns you need, all on one continuous page, all with one print command—and all for only \$60!

With Sideways on your side, no spreadsheet you invent with Lotus 1-2-3™, VisiCalc®, Multiplan™ or SuperCalc™ is too wide! And it's just as powerful an ally when you're creating far-into-the-future schedules and PERT charts with your word processor. In fact, for any wide text file, for dozens of uses, the way to go is Sideways.

The experts agree. PC Magazine, for example, writes: "If you've got the need, Sideways has the solution." And PC World calls Sideways "nifty . . . an easy to use program that does what it claims."

You can go Sideways today with an IBM® PC or an IBM® Epson, Okidata, Prism™ or Pro-writer™ printer. Ask for Sideways at your local ComputerLand® or other leading computer stores. Or mail a \$60 check to Runk Software, P.O. Box 1290, Cambridge, MA 02238. (617) 497-6339. MC/V/isa accepted. Send no Mexican jumping beans, please.

THE 8087 IS IN STOCK!

Micro Ware is the world's leading retailer of 8087's. We also have the most accurate statistics on chip reliability. They are: .01% infant mortality, .00% adult mortality and .02% 8088 incompatibility. As for ease of installation, we have never had a customer return a chip because of bent pins. We are so confident that you will be able to successfully install and use the chip that we offer a 180-day warranty with every chip we sell. That's 90 days more than anyone else!

To support the 8087 we stock the largest selection of 8087 software anywhere. This includes: three FORTRANs, three PASCALS, APL, Intel's ASM86, PL/M-86, several Cs, 87BASIC, 87MACRO and MATRIXPAK. For real time or multi-user applications we offer RTOS™ - our implementation of Intel's iRMX executive. Our new products include a professional debugger with 8087 support, an interface library which enables MS Fortran users to call the IBM Basic

Compiler Library, and a translator that converts object modules into readable assembly language files. If you have a question about which computer, language, compiler, operating system or application package is best suited to your problem, we can answer it. Just call: **Information and Orders—**

Micro Ware™ 8087 Support

87FORTRAN/RTOS™ - our adaptation of the Intel Fortran-86 Compiler generates in line 8087 code using all 8087 data types including 80-bit reals and 64-bit integers. The compiler uses the Intel large memory model, allowing code/data structures of a full megabyte, and supports overlays. Includes RTOS and support for one year.....\$1350

87PASCAL/RTOS™ is Intel's ISO-Standard Pascal with 8087-8088 exceptions. These make it possible to use all the 8087 data types directly, while generating modules in one of the three Intel Memory Models. Includes RTOS and support for one year.....\$1350

RTOS DEVELOPMENT PACKAGE includes 87FORTRAN, 87PASCAL, PL/M-86, Utilities, TXScreenEditor and RTOS.....\$2500

RTOS—
**REAL TIME MULTI-TASKING/
 MULTI-USER EXECUTIVE**
 RTOS is a Micro Ware configured version of iRMX-86. Includes ASM-86, LINK-86, LOC-86, LIB-86, and the ROM Hex Loader.....\$600

MWS-286™ Configured to your specifications, our computer runs RTOS-286 or XENIX. Includes one Intel computer, seven slot multibus chassis, hard disk, streaming tape backup and Intel Service Contract. Six to twenty times faster than your PC.....CALL

OBJ→ASM™ - a multipass object module translator and disassembler. Produces assembly language listings which include public symbols, external symbols, and labels commented with cross references. Ideal for understanding and patching object modules and libraries for which source is not available.....\$200

PC TECH JOURNAL REVIEW:
 "The Micro Ware package is preferable ... it executes the basic operations more rapidly and Micro Ware provides a free update service."

87BASIC™ includes patches to the IBM Basic Compiler and both runtime libraries for USER TRANSPARENT and COMPLETE 8087 support. Provides super fast performance for all numeric operations including trigonometric, transcendental, addition, subtraction, multiplication, and division.....\$150

87BASIC/INLINE™ generates inline 8087 code! Converts the IBM Basic Compiler output into an assembly language source listing which allows the user to make additional refinements to his program. Real expression evaluations run five times faster than in 87BASIC.....\$200

87MACRO™ - our complete 8087 software development package. It contains a "Pre-processor," source code for a set of 8087 macros, and an object library of numeric functions including transcendental, trigonometric, hyperbolic, encoding, decoding and conversions.....\$150

87DEBUG™ - a professional debugger with 8087 support, a sophisticated screen-oriented macro command processor, and trace features which include the ability to skip tracing through branches to calls and software and hardware interrupts. Breakpoints can be set in code or on guarded addresses in RAM.....\$150

FOR→BAS™ - a library of interface routines which allow MS Fortran programs to call the IBM Basic Compiler library and access features such as the RANDOM NUMBER GENERATOR, SOUND, PLAY, DRAW and SCREEN commands.....\$150

8087-3 CHIP.....\$175
 including DIAGNOSTICS and 180-day warranty
64K RAM Upgrade.....\$47.50

87/88GUIDE™ - an excellent tutorial on writing 8087 code and interfacing it with compilers. Full of code that runs!.....\$30

MATRIXPAK™ manages a MEGABYTE! Written in assembly language, our runtime package accurately manipulates large matrices at very fast speeds. Includes matrix inversion and the solution of simultaneous linear equations. Callable from MS Fortran 3.2, 87MACRO, 87BASIC, and RTOS.....each \$150

MICROSOFT FORTRAN 3.2.....\$239
MICROSOFT PASCAL 3.2.....\$209
 These IEEE compatible compilers support double precision and the 8087

MICROSOFT C COMPILER includes Lattice C and the MS Librarian.....\$350

Relax: Help Is on Way for Stressful You and Your PC

NEW YORK—For many users, computers cause increased levels of stress. Now Synapse Software of Richmond, Calif., has introduced a new hardware/software combination for the IBM PC, called *Relax*, that combines biofeedback, autogenic training, and progressive relaxation techniques pronounced to help understand and reduce stress.

One of the keys to avoiding the harmful effects of stress, which affects almost everyone today in one way or another, says popular psychiatrist Dr. Joyce Brothers, is to learn to control and use it, rather than letting it control you.

Sensing Tension

Relax, unveiled here recently, lets you do just that, boasts Synapse, which sells software for the home. The system uses an electromyograph (EMG) to sense muscle tension in the forehead, generally accepted by scientists as an indicator of overall stress levels. The package then converts this reading into dif-

ferent kinds of visual displays—graphically showing the user how much stress is being experienced.

The displays include a clinical-appearing, continuously scrolling graph; a kaleidoscope pattern that varies color and complexity according to the tension level recorded; and a videogame that lets you "use your mind as a joystick," which rewards control of your stress level (making it rise and fall) with higher point scores.

Besides merely lowering stress while using the system, Ihor Wolosenko and Kenneth Grant, Synapse's founders, and Dr. Martha Davis, project manager for *Relax*, believe that the system's real usefulness lies in helping people practice techniques they can use to control stress when it occurs. Training with *Relax*, they claim, teaches users personal methods of relaxation applicable to many situations. The system can be used to identify some of the causes of stress affecting an individual, they suggest. Imagining possi-

The headband contains sensors that detect tension in forehead muscles. *Relax* displays these readings in a graph on screen.

bly stressful situations and then watching the visual feedback provided by *Relax* can give an accurate measure of the degree of stress a person associates

with that particular problem or situation.

Synapse sees *Relax* opening up an entire new genre of computer software: not business related, but not a game either. They hope to release other personal development software that fits this mold.

Strap on the Band

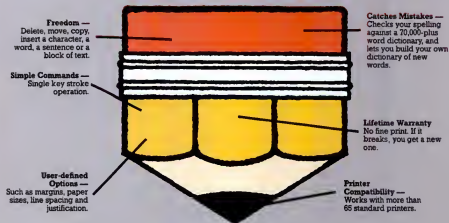

The *Relax* package consists of a headband holding the three EMG sensors; a control unit that can vary the sampling rate from slow (to give a reading of overall stress) to very fast (to provide information on specific stress reactions); a deep-relaxation audio tape; and a workbook of the system's documentation and guidance on managing stress, including instructions on how to create a personal stress management profile and stress reduction plan.

Relax is available for the PC and PCjr; it retails for \$139.95. More information can be obtained from Synapse Software, at 5221 Central Ave., Richmond, CA 98404, (415) 527-7751. —Frederic Paul

Relax generates a kaleidoscopic pattern that mirrors your tension level.

Compared To FRIENDLYWRITER™ FRIENDLYSPELLER™ A Pencil Is Tough To Operate.

FriendlyWriter™/
FriendlySpeller™, the
word processor and
spelling-checker from
FriendlySoft is so easy to
use it makes writing with
a pencil seem difficult.

In about 10 minutes on
your IBM® PC, XT or PC
Jr, you can learn to write
rings around your pencil.
And you can check the
spelling of more than
70,000 words in another
few seconds.

FriendlyWriter/
FriendlySpeller is the
perfect word processing
package for home and
office. Visit a computer or
software dealer near you
and ask for a demonstra-
tion. If your dealer is not
stocking it, let us know.

Memories Are Made of This

Remember those summers when everyone piled into the old Winnebago and drove into the scenic heartland of America. When we got there, after several mind-soothing days on the road, we liked nothing better than to head into a gift shop and pick up postcards and various silly souvenirs, gifts, and gewgaws. Things we'd be too embarrassed to buy close to home, but—let's admit it—we're only too glad to have an excuse to acquire.

Now summer's come again, but last winter we sold the Winnebago to buy a 20-megabyte hard disk and a 4-color plotter. Since then we've stuck close to our homes and PCs, but our secret desire for knickknacks is burning on unsatisfied.

Take heart! Two mail order companies are ready to fix you up with precious *chatchkas* that look like prizes for games at a PC theme park.

Harriet Carter's 110-page catalog is a traditional source of gifts for friends and relatives who fancy cats and dogs, gardens, thimbles, trains, fly fishing, and leprechauns. In this year's catalog, Carter offers about a dozen computer-related items alongside her chocolate-scented memopad, the ceramic English bulldog that plays "Chariots of Fire," the maternity mug (don't ask), and the plastic penguin lawn ornament.

What are the PC counterparts to these tacky tidbits? A 2-inch-wide wind-up computer and another tiny PC with an LCD digital clock for its screen. A memopad made of greenbar printout paper. T-shirts with official computer excuses or the message, "Real men don't have floppy disks." Mens briefs with "Personal Software" printed across the backsides (these are packaged in a box that resembles the IBM PC's keyboard). A mug saying "Old computer people never die—they just lose their memory" is across the page from a cassette tape that improves your memory through hypnotism. And you can grace your workplace with a truly

original *objet d'art*: a framed picture of two mice (each sketched around a thumbprint) in a scene with the motto, "Computers...make the world go round."

Ordering these items from the Harriet Carter catalog should help satiate your urge to make a shopping expedition to Little

America or the Corn Palace. To get on the mailing list, write to Harriet Carter, Dept 14, North Wales, PA 19455.

Superior Gifts

A far more sophisticated selection of computer novelties is offered by Sweet Gum, Inc., of North Miami, Florida. Al-

though its name doesn't even hint of technical specialization, this company is dedicated to computer-specific goods. Consider Sweet Gum's mahogany, oak, and cherry joysticks. Or dressy ties with diskette checks. Computer-art greeting cards and a microchip jigsaw puzzle. Binary clocks and watches, with analog hands that circle the hours from 0001 to 1100.

For the sports minded programmer, "Computer Jock" wristbands and T-shirts are available. For the enthusiast, swatches of core memory (unstitched by hand from the innards of an IBM 360) are available handsomely framed or embedded in a lucite block.

Sweet Gum is also a source for programmable coffee mugs that display a "Computer Expert On Duty" message when empty, but automatically change to "Off Duty" at break time when you loaded up with hot coffee.

If you want to peruse this tasty catalog, write to Sweet Gum, Inc., 15490 N.W. 7th Ave., North Miami, FL 33169, (800) 237-9338.

—James Langdell

IBM's XTs Make Culture Touching

NEW YORK—Visitors to New York who are searching for information about city attractions have new helpers—specially programmed IBM XTs with touch-sensitive color video screens. Located in the lobby of the IBM Gallery of Science and Art, these NYCulture Guides give tourists computerized access to information about 244 museums, historical sites, zoos, exhibits, and botanical gardens around New York City.

Simply by touching a screen, visitors can call up the information in the guides, which is listed geographically, alphabetically, and by subject matter. For the geographic listing, the touch screen, produces a graphic video map and all a visitor has to do is touch an area on the map to get information about attractions in that particular area of the city.

Another way of accessing information is by using the alphabetical listing. For example, if you were interested in visiting the Museum of Modern Art (MOMA), you would call for a listing of institutions that begin with the letter M. After selecting the MOMA, you would then see a series of graphics and explanations representing different categories of information including specific exhibits, special attractions, museum hours, facilities, and special provisions for children and handicapped.

Information in the guide is updated monthly. There are five

"towers" with two screens on each, enabling one person to use the bottom screen while others can watch the same information displayed on the top screen. They are easy, fun, and free and can be used Tuesdays through Fridays, 11 a.m. to 6 p.m., and Saturdays from 10 a.m. to 5 p.m. IBM's gallery is at Madison Avenue and 56th Street.

—Jane Mintzer

PC/Disk, Microsoft Chart a New Course

NEW YORK—The next issue of *PC/Disk* (formerly *PC Disk Magazine*) will, for the first time, include a demo version of a new business graphics software package—Microsoft's *Chart*.

PC/Disk users can try out this software by first following a printed 15-page guide that explains—keystroke by keystroke—how to do several tasks. Then, users can play freely with *PC/Disk*'s nearly complete version of *Chart* (no saving or printing allowed, however).

The new software demos won't squeeze any real programs off the disk. *PC/Disk* is doubling its size by using double-sided disks, and will offer more original software in each issue than ever before.

To obtain the *PC/Disk* with Microsoft's *Chart* (Volume 1 Number 8), send \$35.95 to *PC/Disk*, P.O. Box 5930, Cherry Hill, NJ 08034. (A 3-issue subscription is \$84.)

This is THE PASCAL COMPILER You've Been Hearing About

"It's almost certainly better
than IBM's Pascal for the PC...
Recommended."

Jerry Pournelle
Byte, May 1984

\$49.95

"If you don't have CP/M [for
your Apple], Turbo Pascal is
reason enough to buy it."

Cary Hara
Softalk Apple, May 1984

VERSION 2.0

"If you have the slightest interest in Pascal... buy it."
Bruce Webster, Softalk IBM, March, 1984

And Now It's Even Better Than You've Heard!

- Windowing (IBM PC, XT, jr. or true compatibles)
- Color, Sound and Graphics Support (IBM PC, XT, jr. or true compatibles)
- Optional 8087 Support (available at an additional charge)
- Automatic Overlays
- A Full-Screen Editor that's even better than ever
- Full Heap Management—via dispose procedure
- Full Support of Operating System Facilities
- No license fees. You can sell the programs you write with Turbo Pascal without extra cost.

Yes. We still include Microcalc... the sample spreadsheet written with Turbo Pascal. You can study the source code to learn how a spreadsheet is written... it's right on the disk.* And, if you're running Turbo Pascal with the 8087 option, you'll never have seen a spreadsheet calculate this fast before!

*Except Commodore 64 CP/M.

Minis and mainframes have used WordMARC for four years. Now there's WordMARC word processing for your micro.

Originally created for minis and mainframes, WordMARC is now available for use on your micro*. And quite simply, it's the best office-quality word processing software package a micro user could buy. After all, it was the best word processor mainframe and mini users like universities, national laboratories, and Fortune 500 companies could find over the last

four years. But, if you need more proof, read on.

☐ *No Problems, No Nonsense, No Competition.* For starters, every-

thing you see on your screen appears exactly as it will be printed on paper. Scientific notation. Foreign language characters. Underlining. Subscripts. Every-

thing. ☐ *A Partial List of Features. That's Right, Partial.* Menu driven w/function keys. Easy self-

paced tutorials. Spelling checker. Mail merge. Scientific notation. Foreign lan-

guage characters. Automatic reformatting. Automatic pagination. Document recovery system. Document encryption. ASCII file handling. And so on. ☐ *If Word*

Processing's Your Call, Call 800-831-2400.

Granted, just because the call is free is no reason for picking up the phone. You should stop and consider

our track record with minis and mainframes.

You should stop and think what that can mean for your micro. And you should stop thinking about any other word processing software. OK. Now that you've done that, it's time to pick up the phone.

*WordMARC is compatible with the IBM PC or XT, as well as the Eagle, Compaq, Corona, NCR PC, DEC Rainbow, and TI Professional computers. All versions of WordMARC on micro, mini and mainframe computers are compatible.

PRODUCT REVIEW

ZCARD: Just in Time For the Holidays

BY JAMES LANGDELL

ZCARD

ZBANNER

Zazda Software
Omni International, Inc.
P.O. Box 11708
Kansas City, MO 64138
(816) 356-7612

List Price: ZCARD, \$49.94,
ZBANNER, \$24.95
(both \$69.90)

Requires: 64K, DOS, one disk
drive, dot matrix printer
(ZCARD requires graphics
printer).

"What can I do with a home computer?" If this question were asked on *Family Feud*, the top five answers would probably be:

1. Play games
2. Help my kids in school
3. Balance my checkbook
4. Store my recipes
5. Keep my Christmas card list

If you've already put the fifth item into practice, you can have even more of a Silicon Christmas by using ZCARD and your PC to create the cards themselves. ZCARD lets you design customized cards by fitting your own greetings around the illustrations in any of ZCARD's 32 card formats. The ZCARD disk provides six different styles of Christmas cards—including three with Santa Claus.

If Santa stuffs ZCARD into your stocking this year, you won't have to wait 11 months to boot up—it's a disk for all seasons. It's ready to print out customized cards for holidays, birthdays, and weddings. ZCARD isn't funeral- and bar mitzvah-compatible yet, but it's loaded for Groundhog Day.

Some card designs are for other specific holidays: hearts for Valentine's Day, a jack-o-lantern for Halloween, a turkey for Thanksgiving, elephants and donkeys for Election Day, and a leprechaun for St. Pat-

rick's Day. Two are suitable for birth announcements, but only one illustration—an elephant sitting on a cake—is specifically for birthdays.

There's no need for that elephant's cake to get stale by serving it up at every birthday. ZCARD has a varied repertoire of 13 non-seasonal images that could accompany your birthday and friendship greetings and gaglines. Pictures of swans,

cannons, trophies, clowns, Garbo, Bogart, or Teddy Roosevelt are as close as your IBM graphics printer.

In its ZCARD package, Zazda provides a stack of ivory tinted heavy card-stock paper with fan folds and perforated borders, ready to feed your IBM or Ep-

ble message fit needn't be a process akin to solving a diagramless crossword puzzle.

When you're ready to print your card, load ZCARD, select the format from a menu, then fill your text in the fields on screen. Then say how many copies you want to print (from 1 to 99), and start printing. It takes about 4 minutes for each card to print out.

If your creativity isn't satisfied just by writing the messages on your cards, soon Zazda may provide artistic freedom as well. The company plans to make available ZCARD DRAW, a commercial version of the joystick-guided drawing software used by Wayne E. Hohl to illustrate most of the cards in ZCARD's collection.

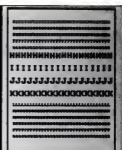

Writing on the Walls

If you have feelings that seem too large to convey through puny 4½-by-5½-inch cards, you could express them to the world on a banner, generated by your PC and ZBANNER, a related Zazda program. ZBANNER gives you a flexible edit screen on which you can design your huge messages. Letters can be formed of any characters in 15 different sizes, with black-on-white or reverse images. You

can position characters at the top, center, or bottom of the printer's paper.

Personal Messages

To design a card, first browse through the samples in ZCARD's manual until you see an illustration that suits your occasion. Each card format offers numerous lines where you can place letters of a given size. The formats usually have enough options so that making a suit-

can position characters at the top, center, or bottom of the printer's paper.

You can modify all these different characteristics throughout a single banner. This flexibility might have made specifying a banner a very complicated process, but the program offers sensible default values for every design feature. ZBANNER won't force you to be any more creative than you want to be. ■

PRODUCT REVIEW

Transfer Rates Make IBM's Cluster Less Network, More File Copier

BY WINN L. ROSCH

IBM Cluster System

IBM
P.O. Box 1328
Boca Raton, FL 33432
(305) 241-2733

IBM Personal Computer Cluster Program	\$ 92
IBM Personal Computer Cluster Program Five-Pack	400
IBM Personal Computer Cluster Adapter	340
IBM PCjr Cluster Attachment	400
IBM Personal Computer Cluster Cable Kit	110

If you call IBM's Cluster system for linking PCs together a "network," company spokesmen will reel away in horror. They're quick to defend that it is not a network, even though a sketchy description might make you think that's exactly what the Cluster is.

Like a network, the Cluster hardware, announced in February and now available, connects PCs, XT's, and PCjr's using coaxial cable (standard RG-59). With this new Cluster software, each PC can talk to the others, share files, and generally act as if all were networked together.

However, unlike most networks, the Cluster only permits file sharing and sending short messages—electronic memoranda—through the system. It does not permit peripherals (for instance, a high-speed laser printer) to be shared or controlled from remote workstations. This helps to prove IBM's point: It takes more than a coaxial cable to make a network system.

Though the Cluster may not be on par with a network, it does open new territory. Essentially, it's a distributed processing system with a medium-speed communication and file transfer link, and it has its own niche between multi-user systems and true networked systems. It can be quite cost effective, particularly once several PCjr's are tied in. A complete five or six workstation system might run as

low as under \$10,000—complete with the IBM stamp of approval.

Leisurely Transfer

Notwithstanding the coax connection—which might imply multi-megahertz speeds like Ethernet—Cluster shuffles messages and data back and forth at a leisurely 375 kilohertz, in the same league as floppy disk speeds (typically 500 kilohertz) and roughly 40 times faster than a simple RS-232 connection. Loading a file from the Clustered hard disk also goes at floppylike speeds—for instance, expect to wait about 7 seconds for WordStar to be ready for your anxious fingers.

Rather than allowing direct data transfer, the Cluster software merely sets up a shared Winchester system. Winchester disk space in a master disk-server XT is divided up among the various workstations in the system. Information and messages are exchanged essentially by copying files back and forth.

Part of the server hard disk is given over to public files, which can be read by any station but written to only by a single designated public volume manager. Another part of the hard disk (maximum size, 360 kilobytes) may be used as a remote reset volume, allowing PCjr's in the system (which cannot be equipped with their own disk drives because the Cluster

adapter draws too much current from the PCjr's meager supply) to boot up from the master Winchester. The balance of the server hard disk is sliced up as private volumes, one per Cluster station. (Unused space is essentially a private volume of the disk server station.)

Idiosyncratic Menus

The Cluster software for data and messages transfer is menu-driven. Like most menus, it's easy-to-use, but at times inconsistent and idiosyncratic. For instance, escaping from the information transfer program, which you must do every time you want to send or read an electronically dispatched message, is a romp through three layers of menu, each step requiring a different keystroke. Another minor annoyance is the Cluster's demand that you press keys 1 or 2 to indicate disk drives A: or B: Why?

To link the Cluster together, the information transfer program must be left running at all times. It quietly finds a place in the background, stealing just enough time from normal CPU operation so that it might be unnoticed—except for a discernible chunk of memory it swallows up. With both DOS 2.1 and Cluster's information transfer program in memory, almost a full 64 kilobytes are eaten away (only 55 kilobytes of useful memory are left on a 128K PCjr after display memory is subtracted).

Getting the Cluster to run each day requires more than just switching on the disk server station. Before joining the Cluster, each workstation must individually run the information transfer program, requiring some user interaction (button pressing). For example, putting the program in an AUTOEXEC.BAT file (automatic execution at boot

up) will require those keystrokes be directed from another file.

Trouble Shooting

Nor is the Cluster trouble-free in operation. If you switch off, accidentally unplug, or otherwise remove the disk server station from service, the individual Cluster workstations get no warning that their shared disks have vanished. And merely turning the server back on doesn't bring back the missing disks or re-establish the network.

A minor problem at the server station can become a big problem at the diskless workstations. Though they can continue to work on whatever is in their memories, any call to their now nonexistent drives will bring the world crashing down. There appears to be no way to save work in progress.

Because the whole Cluster system is based on the single hard disk, larger systems can be easily tied up. If any user calls for a directory from the master hard disk and stops it from scrolling off the screen, the hard disk becomes inaccessible to anyone else in the Cluster until the scroll finishes.

XT Required

Up to 64 IBM computers can be clustered, of which one must be an XT (or PC with IBM hard disk) to act as the disk server. I found out when the XT requirement when I tried using my plain vanilla PC with another manufacturer's add-on drive and two PCjr's. I ended up having to borrow an XT from a friend to bring the system to life. My preliminary tests revealed that the Cluster was completely unwilling to function with other manufacturers' add-on Winchester's!

IBM wisely warns that approaching the 63 slave station limit with diskless computers will most likely be unworkable. The practical limit is largely dependent on the need for disk access, but a dozen machines seems reasonable.

Each full-size IBM personal computer requires its own full-length Cluster adapter board. (continued)

IBM's Cluster (continued)

Each PCjr requires a separate Cluster adapter that plugs in like the PCjr parallel printer connector. Each computer in the system must also have a sepa-

rate Cluster license—which comes with the software.

IBM will be the first to warn you that the Cluster will not give you true network performance and that if you want a real IBM

network, you'll have to wait a few years. But if you understand the Cluster's idiosyncrasies and limitations, the system can be an effective solution in that vast middle ground where

one PC is too few and a true network—at several thousand dollars per node—is too expensive. Just be sure to buy an interruptible power supply for your Cluster disk server station. ■

Companies in Search of Excellence

Use ProKey™ to make their software more efficient.

Sometimes, the simplest ideas are also the best formulas for success.

Like a \$130 software enhancer called ProKey.

With ProKey, you can define any key as an abbreviation for thousands of characters or command sequences.

And repeat them with one keystroke!

Use ProKey to log onto a mainframe in moments.

Update a spreadsheet and print a graph when you touch a single key.

Or make sophisticated programs like dBase II far easier to operate.

In fact, ProKey can integrate all your software into a complete turnkey system that automatically loads and operates programs.

CIRCLE 406 ON READER SERVICE CARD

And by reducing complex commands to simple keystrokes, ProKey dramatically simplifies training and documentation!

ProKey is an excellent idea that's available at computer stores everywhere.

To find out more, send for our free 16 page booklet, "The Power of ProKey."

RoseSoft™

4710 University Way N.E.
Seattle, WA 98105
(206) 524-2350

To run ProKey, you'll need an IBM PC, XT or jr, or a compatible and DOS 1.0 or later version including 2.1. dBase II is a trademark of Ashton-Tate. Corporate and OEM licenses available.

USING?...BUYING?... UPGRADING?...

A GRAPHICS PACKAGE FOR YOUR PC

You have to create graphs and charts to tell your story. Your needs vary from financial statements and personnel benefits to inventory records...presentations are made on printouts, slides and tele-monitors...and for the most part, a salesman or a representative other than yourself makes the presentation. You really need a good and simple graphics package, one that will help you tell the story, without using a lot of your valuable time. You need **DESKTOP GRAPHICS FOR THE IBM PC: PRINTERS, PLOTTERS, CHARTS AND GRAPHS**, the fully illustrated guide to the preparation, design and production of business graphics. This is a book written with you in mind, the business or professional user with little technical or statistical knowledge, using or planning to purchase a graphics package.

Topics include: • What hardware options you have • What software will best meet your needs • What charts are available to you and your IBM PC • What data works best with each chart • What is the difference between a mean, mode and median • How to shoot slides directly from the screen • Visi-trend - Peachtree - BPS - 1, 2, 3—what's right for you.

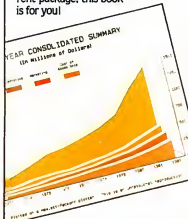

Author Corey Sandler gives you clear and non-technical introductions to graphing theory and statistics, explaining and evaluating your hardware options (including printers, plotters and monitors), plus so much more!

If you've been contemplating buying a new graphics package or just want to get more out of your current package, this book is for you!

For faster delivery.

People in the News

Ralph and Randy Nelson

A father-son team created, and now maintain and market a clever database for tracking information about the IBM PC

BY BIL. ALVERNAZ

PALO ALTO—When Ralph Nelson set out to solve his problem of keeping track of magazine articles about the IBM PC, he didn't realize so many other PC owners were in the same dilemma.

It took Ralph's 18-year-old son, Randy, however, to realize the marketing potential of what his father so painstakingly created. A physicist at the Stanford (University) Linear Accelerator Center in California, Ralph originally bought a PC both to work at home and to access the mainframe computers at Stanford.

Then the frustration started. "I was hooked on the PC," says Nelson, whose computing experience goes back two decades. "But I just couldn't keep up with reading all of the articles, let alone remember where I read what."

Using *PC-FILE III* (the popular, user-supported database) Nelson created a database of magazine articles, letters, and news features about IBM Personal Computers. Nelson's simple and to-the-point structuring of the database proved the key to success of his ultimate product, *LETUS A-B-C*. Each article's listing includes a brief abstract. Searching for articles can be done by key word, subject, title or author—even month. What Nelson created is an overlay to be used with *PC-FILE III*.

LETUS A-B-C stands for Literature Evaluation Table User Service and is marketed like *PC-FILE III* (see "People in the News: Jim Button," *PC* Volume 3 Number 16, page 66). Customers send blank, formatted (double-sided) diskettes to Nelson at 3790 El Camino Real, Suite 2006, Palo Alto, CA

94306, (415) 493-4306, and he will copy *LETUS A-B-C* onto the disk. Then, after you use the product, "your contribution of \$20 will be appreciated." Or, users can send in \$20 for three months' database overlay.

Database listings of articles in *LETUS A-B-C* go back to 1982 (the "old days" according to Nelson). The complete reference set of four disks costs \$40, with each additional quarter now \$20. That complete set of *LETUS A-B-C* includes the following:

Disk #1: 1982—*PC Magazine*, *Personal Computer Age*, *Softalk*, and *Byte Magazine* (only the articles relating to the PC). Also included on this disk is a 10-page manual on using *LETUS A-B-C*.

Disk #2: 1983—*PC Magazine* (through June), *Personal Computer Age*, and *Softalk*.

Disk #3: 1983—*PC Magazine* (July to December), *PC World*, *The PC Tech Journal*, and *Byte Magazine* (only PC articles).

Disk #4: 1984 (1st quarter)—*PC Magazine*, *Personal Computer Age*, *PC World*, *PCjr Magazine*, *The PC Tech*

Journal, *Softalk*, and *Byte Magazine* (only PC articles).

LETUS A-B-C contains all articles—"and just about everything else," says Randy Nelson—from those magazines. With each new quarter this year, Ralph and Randy plan to include more information with each issue of *LETUS A-B-C*. Subscription to the basic database overlay will stay at \$20 per quarter, but for an additional \$10 per quarter subscribers can get databases of additional magazines and also abstracts on IBM-related books.

Filling a Need

Randy Nelson didn't have to talk too much to convince his father to market *LETUS A-B-C*. Together they are now learning about marketing, business, people, and each other. Not that there were problems with their relationship to begin with, but this business has brought them much closer. "We're having a lot of fun with something that only Randy and I believed in to begin with," Ralph says proudly.

Both Ralph and Randy Nelson attribute their success to "having filled a definite need for

IBM PC owners," and to the "guidance and encouragement" from Jim Button, author of *PC-FILE III*. Button's quiet and successful marketing concept, which the Nelsons have adopted, is "user supported software." This approach encourages users to copy and share the diskettes with others. That virtually eliminates the costs for marketing and distribution—and keeps the product affordable.

Though this PC success is somewhat new to Ralph, he has established his own identity in his profession as radiation/health physicist. He has written books and dozens of articles, and he enjoys a position he has held at Stanford since 1958. "It's the best of all worlds," says Ralph. "All of this and I'm now working with my son, too."

Filial Interest

Randy Nelson, who graduated in June from Gunn High School, plans to pursue a career in computer science. A year ago he didn't know much at all about computers and wasn't too interested in what his father was doing with the IBM PC. However, since their involvement with *LETUS A-B-C*, Randy has studied BASIC at Foothill Junior College (while still in high school).

And at the rate Randy is going he just might be teaching a class before too long—on how to market software.

LETUS A-B-C works with DOS 1.1 or 2.0 (and newer versions). *PC-FILE III* is available from Jim Button, Box 5786, Bellevue, WA 98006, for \$49. (He no longer copies the program onto diskettes sent in to him.)

When you're last
to the party,
you better bring

something special. Like a 10 Megabyte Winchester for \$888.

The great price is just the beginning. You see, the reason we're late is we took a little more time getting ready. For two years we have searched for the right components at the right price. Anybody can buy controllers and drives, make up a name, and presto, they are in the hard disk business. In fact, some of the biggest names in the industry have done just that. To do it right, takes much more than just hunkering the nearest components.

Anybody Want a V-8?

Adding a hard disk to an IBM PC can be very much like stuffing a V-8 engine in the back seat of your VW bug. There is room to put it there, and you will have one last beetle - but you create a whole new set of problems. Like excessive power drain. IBM didn't plan for a hard disk in your PC, so they put in a meager 63.5 watt power supply (XT's have 130 watt power supplies). Most of the hard disks out there need so much power to run them that you can barely add any expansion boards and still have enough power to operate with. And all that power results in excess internal heat - reducing the life of electronic components.

Cool & In Control

Qubie has attacked the power/heat problem with a state of the art controller and drive that draw less power than any on the market today. Start with our controller. It uses LSI (Large Scale Integration) technology to lower the number of components on the board and provides significantly faster performance. Fewer components require less power. Less power means less heat. More power left for other expansion boards, and lower operating temperatures inside your PC. Our half-height drive draws the same amount of power as a floppy disk, and is the lowest power consuming drive on the market today.

Portable Plus

We selected a half-height drive that can be used in an IBM PC, Compaq, or a PC portable. In fact we use the same drive and controller used in the Compaq Plus computer. The drive's specially plated media allows it to stand up to the rigors

of the real world. It can even operate at any angle. No need to treat your PC or Compaq like a piece of antique china just because you have added a hard disk. And no need to spend hundreds more when you can get the same components at a Qubie price.

Complete Package

Included in the package is everything you need to install it yourself. 10Mh winchester drive, controller, cables, mounting hardware, and step by step instructions to explain the installation. We also include the popular 1dtr "visual shell" software. It will allow you to take full advantage of the many features of DOS 2.0 or 2.1 without having to invest the time to figure out the manuals.

Need More Power?

If you have some power hungry expansion boards already in your PC, you may need more power in order to add a hard disk system. If so, no problem. For \$88 we have an auxiliary power supply which plugs onto the back of your PC and provides all the power needed to run your hard disk drive. This is a IBM PC only problem as all the popular compatibles have substantially higher power supplies than does the IBM PC.

Why Buy From Us

Because besides having the best hard disk system on the market, we stand behind it and you. You get direct technical support after the sale. If at any time during the one year warranty period your system should require service, we will fix it or replace it within 48 hours. Notice there are no hidden charges in our price. No extra for freight, credit cards, COD fees, or insurance. If you still are not convinced, and are ready to buy another brand of hard disk, ask them if they will take our acid test.

The Acid Test

Qubie gives you a 30 day satisfaction guarantee on our hard disk system. If for any reason you are not satisfied with your purchase, you may return it for a complete refund including the postage to return it. If you can, get any of our competitors to give you the same guarantee. Buy both and return the one you don't like. We know which one you will keep.

Optional Power Supply

SYSTEM REQUIREMENTS: Any IBM PC with 64k RAM. PC DOS version 2.0 or 2.1. Compatible owners call for application information.

Qubie PC10 with 10 Megabyte 1dtr "visual shell" software, installation hardware, and instructions.
1 year warranty. \$888

Qubie Q510 Optional Hard Disk Power Supply for users with fully loaded PCs.
Instructions. 1 year warranty. \$88

HEXEL Half-Height base for drive. \$15

**The Office
UNIX System**

UNISOURCE

WE DRESSED IT UP. NOW YOU CAN TAKE IT ANYWHERE.

Introducing *The Office UNIX* System for the IBM PC.

We took the best implementation of AT&T's UNIX operating system designed especially for the IBM personal computer - *VENIX/86*.[™] Then we created an elegant but simple menu interface tool to make it more user friendly. And, finally, we selected top-notch applications for decision support, database management, electronic mail, word processing, and more. We call it *The Office UNIX System*.[™] It gives you the most advanced, interactive, multi-tasking, multi-user environment available on the IBM PC. Let us tell you more.

Yes, it's a real UNIX.

VENIX/86 is from VenturCom, the leading UNIX software development company, which pioneered UNIX for microcomputers. They tailored UNIX for the IBM PC to optimize memory usage, speed, and system reliability. The standard distribution includes: four editors, a C compiler, BASIC, an assembler, yacc and lex. Plus UNIX to UNIX system communications (UUCP and CU), document preparation (nroff), a spelling checker, a table formatter, a wide range of library routines, and more. VenturCom even remembered the UNIX aficionado by including the UC Berkeley enhancements vi, termcap, more and the c shell. Electronic mail, calendar and reminder functions are, of course, standard. The hard disk can be partitioned to permit both UNIX and PC-DOS files. So look no further. *VENIX/86* is a complete and faithful UNIX implementation.

New for UNIX Users!

To make *The Office UNIX System* easy to use, add our new *Office Menu Tool*.[™] It allows you to choose from a set of prepared menus or you can make your own. Menus can be constructed

with multiple levels, each with their unique descriptions and help screens. That's not just user friendly, that's UNIX friendly!

Do we have applications?

You bet! For word processing, add the highly acclaimed *The Final Word*[™] from Mark of the Unicorn. *Viewcomp*,[™] from Unicorp Software, gives you all the features you expect in an electronic

spreadsheet. Take care of database management needs with *Leverage*[™] from Urban Software. *Leverage* is menu driven, has substantial online help screens and can generate reports, mailing lists and letters. *FUSION*,[™] a product of Network Research Corp., lets you join the Ethernet.[™] Naturally, we'll continue to review and offer more applications and UNIX tools.

Multi-user on the IBM PC.

Connect two display terminals to your IBM PC and have three users share the same PC, disks, and printer. This economical yet powerful multi-user system offers all the features, storage and convenience of a much larger system. Plus you get the benefits of IBM and UNIX.

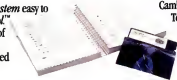

Start building your Office UNIX System today by purchasing *VENIX/86*. Make it easy to use by adding the *Office Menu Tool*. Then buy the applications best suited to your needs. There's a lot to choose from!

Now that we've dressed it up, you can take UNIX and your IBM PC anywhere. Tied together, they're a natural!

The Office UNIX System is available for immediate delivery. Just give us a call or write to:

Turn Your PC Into an XT+!

DynaFrame is a combination of a hard disk drive with your choice of storage capacity (from 5 to 140 Megabytes ... 8 PCXT compatible expansion slots ... high speed backup and added control through the Front Touch Panel/Display. And, unlike many other sub-systems, DynaFrame is totally compatible with IBM XT software... no software patching is needed!

You have your choice of several back-up systems. Select from a 5 or 10 megabyte removable hard disk drive ... a high density floppy disk drive ... or a 25 megabyte streamer tape.

See the new DynaFrame at your local computer specialist or write for detailed information.

IBM PC and IBM XT are trademarks of International Business Machines. DynaFrame is a trademark of Vista Computer Co., Inc.

Now you don't have to sacrifice print quality for speed. The Canon Impact Matrix Series Printers.

High speed and high quality in one functional, compact unit. That's what Canon's Impact Matrix Printers offer you.

They print hard copy at a rapid 160 characters per second. While in the double pass mode you get an impressive, high-density 23 X18 dot matrix that gives near letter quality printing suitable for word processing.

Canon's unique technology has also dramatically reduced bothersome clatter down to a muted noise level of less than 60dB.

Even at high speed.

And that, unlike many other impact matrix printers, makes them a pleasure to work with.

Plus there's limitless flexibility with the optional down-loading function that lets you print

whatever character fonts your host computer can create. As well as a choice of four different character styles (all printable on the same line) that you can enlarge or condense.

The Impact Matrix Series Printers give you a convenient choice of special paper widths—the PW-1080A for 80-character column printout and the PW-1156A for 156-character column.

Exceptional quality and high speed.

The Canon® Impact Matrix Series Printers give you the best of both worlds.

The right place for the right price

If you live in the New England area (or plan to visit there), you should drop by our **DISCOUNT COMPUTER SHOWROOM**. We're about one hour's drive from Boston, the ocean or the White Mountains. From Boston, just go up Route 3 to Nashua, NH, and take Exit 7W (Route 101A). We're 5.1 miles from that exit, in Amherst NH. Take the next right after you see the Dexter Shoe factory outlet store.

In fact, we're near a lot of New Hampshire's factory outlet stores, and with no sales tax you can save a bundle on computer equipment, shoes and whatever else strikes your fancy. We have several systems on display, as well as printers, modems and monitors, all at the same prices you see in our ads. And if you can't fit a purchase into your car, don't worry—we'll ship it free anywhere in the 48 contiguous states.

No matter where you live—Boston or San Francisco—You don't have to strike out into the wilderness to save money. Take a short drive or drop us a line for the best advice and price on IBM-PC peripherals and IBM-PC compatible computers.

SHOWROOM HOURS: 10-6, Mon-Fri, 10-5 Saturdays

CIRCLE 213 ON READER SERVICE CARD

3M intr one less worry a

We can't do anything about your taxes. Or the rush-hour traffic. Or the person who keeps stealing lunches out of the office refrigerator.

But we can take a big load off your mind when it comes to diskettes.

3M diskettes are certified 100% error-free. And guaranteed for life.

No floppy is more reliable.

There's no way one could be. Because only 3M controls every aspect of the manufacturing process.

We make our own magnetic oxides. And

the binders that attach them to the dimensionally stable substrate. Which we make ourselves from liquid polyester. Which we make ourselves.

We also test our floppies. At least 327 ways. And not just on exotic lab equipment with perfectly aligned, spotless heads. But also on office equipment like yours.

We even reject a floppy if its label is crooked. Some people think we're a little crazy to go to all that trouble. After all, do you really need a diskette that can make one read/write

roduces thing to bout.

The logo for 3M diskettes, featuring the '3M' logo in a bold, sans-serif font, with the word 'diskettes' in a smaller, sans-serif font below it, all contained within a black triangle.

pass on every track, every hour, every day for
the next 200 years?

Not really.

But now that you know a 3M floppy can
do it, you can relax.

And worry about other things.

Like who stole your lunch from the office
refrigerator.

One less thing to
worry about.

ALL AT ONCE!

AND NEVER A "LOCKED OUT" USER!

DataFlex is the only application development database which **automatically** gives you true multi-user capabilities. Other systems can lock you out of records or entire files for the full time they are being used by someone else. DataFlex, however, locks only the data being changed, and **only** during the micro-seconds it

takes to actually write it to the file! The updated record is then immediately available. The number of users who can access, and change, records at the same time is limited only by the number of terminals on your system or network. Call or write today for all the details on DataFlex... the true multi-user database.

DATAFLEX

ATARI[®]SOFT. All the hits your computer is missing.

It's showtime.

Time for ATARI[®]SOFT[™] to show you six exciting, brand new games that are destined for stardom.

Games that can be played on your Commodore 64, IBM PC and Apple II. (Some titles available on IBM PC jr. and VIC 20*)

First, there's *Gremlins*, based on the characters from the original film presented by Steven Spielberg.

Then there's *Crystal Castles*[™] where Bentley Bear[™] journeys through all sorts of tantalizingly difficult paths and ramps in his endless quest for gems.

In *Donkey Kong Jr.*[™] by Nintendo[®], Junior tries to rescue his father against immense odds. And speaking of Donkey Kong, there's also *Mario Brothers*[™] by Nintendo[®]. This time, Mario and his brother Luigi battle creatures on four levels of floors, encountering all sorts of treacherous enemies.

In *Track And Field*[™] you can compete by yourself or

head-to-head with another player. But each player must beat qualifying times, heights and distances before they can compete in each of the grueling six events.

Typo Attack is the much-acclaimed, fun-filled program that

allows you to enjoy developing your typing skills at any level.

And still playing to the delight of audiences everywhere are *Pac-Man*[™], *Ms. Pac-Man*[™], *Jungle Hunt*[™], *Battlezone*[™], *Donkey Kong*[™]; by Nintendo[®], *Centipede*[™] and *Pole Position*[™].

So, if you've been searching for ways to entertain your Commodore, Apple or IBM, treat it to one of the best shows in town, one of the hits from ATARI[®]SOFT.

And don't forget the popcorn.

ATARI[®]SOFT products are manufactured by Atan, Inc. for use with various computers and video game consoles. ATARI[®]SOFT products are not made, licensed or approved by the manufacturer(s) of those computers and video game consoles.

*Titles available on IBM PC jr. are Ms. Pac-Man, Centipede, Donkey Kong, Moon Patrol[™] and Typo Attack. Available on the VIC 20 is Typo Attack.

MAKE THE CONNECTION...IN THE SLOT

Now you can plug the ease of use and leadership features of a POPCOM™ personal communications modem directly into one of the expansion slots of your IBM® PC, XT, Portable, or IBM slot compatible computer.

With the new POPCOM modem from Prentice Corporation...

- Your personal computer becomes essentially a voice and data workstation, and the need for costly extra telephone lines is eliminated.
- Activity on the phone line is detected (most modems don't do this) and the costly extra load placed on your company's internal phone system is reduced.
- You communicate at the fast, economical 1200 bps rate as well as the standard 300 bps rate.
- Telephone numbers you have selected are automatically dialed and redialed if busy, and incoming calls are automatically answered.
- You have compatibility with the popular communications software packages of today, and advanced features that will let you take advantage of the next generation of communications software as well.
- Only one slot in your PC, XT, or Portable is required.

With a suggested retail price of \$445, the C100 means real price/performance. All of these leadership performance features are also available in the external POPCOM X100 modem so now you have a choice...inside or outside.

Consumer Guinea Pigs

The software industry's practice of using the paying public to debug its products has sent consumer confidence through the floor. Producers should be using more beta testers.

The manufacturer of a new software package called me recently and asked if he could receive a prepublication copy of a review *PC* was publishing of his product.

"We can't do that," I told him, surprised that he would even ask. I explained that, as I see it, a review of a product cannot be legitimate if it first has to go to the manufacturer for approval.

"Oh, no, we won't touch the article," the man assured me. "But if your reviewer found any bugs, we want to be able to correct them."

It may be naive of me, but I have always assumed that, when a product finally goes on the market, it is the best that the manufacturer can make. However, it seems that software producers have a different philosophy; they market a reasonably well-researched package and then wait for consumers to report problems.

The scenario goes something like this: A new piece of software that counts angels on the head of a pin goes on the market, and the first few hundred packages are sold. Consumer A purchases a copy of *Angel Counter* on the strength of an ad in a computer magazine, runs the program, and finds that it counts two-winged angels but not three-winged angels. Since consumer A is interested in the three-winged variety, he calls the company and complains.

The head of consumer relations gushes, "We're terribly sorry. Our software people totally missed that problem. We'll fix that immediately and send you a copy of the new version."

Barbara Krasnoff

However, consumer B, who also bought the new software, is unaware that any deficiency existed in the first place, so she is stuck with the uncorrected package she bought—even if she later finds herself with three-winged angels on her hands.

Consumer Anxiety

Manufacturers should note that this state of affairs isn't doing much for consumer confidence. Here at *PC Maga-*

zine, we found out just how anxious consumers are when we recently published our seven-part "Project: Database" series. The day after the first issue came out, we began getting panicky calls from corporate data processing managers who wanted to know how we had rated the database packages in which they were planning to invest several thousand dollars and work hours.

Others, pressured by their superiors to purchase a new database as soon as possible, called us begging for a list of the best-rated products—before the entire series had been published. The message they were sending was that they didn't feel that they could entirely trust the claims of the software manufacturers.

This crisis of confidence is becoming so serious that one of our editorial assistants recently spent 15 minutes on the phone, fending off a *consultant* who wanted to know which of the software packages she would recommend.

I realize that it may be impossible for a software company to catch all the problems in a program by itself. But, at the same time, it is rather unfair to make the public serve as unwitting bug exterminators—especially when it is paying for the privilege.

In fact, as an editor, I object to it myself. When *PC* is paying a writer to review a product, we do not expect to be

Meet the

Standard.

AST SixPakPlus™ has set the standard 100,000 times.

We have manufactured and shipped more than 100,000 SixPakPlus multifunction boards — an event that proves quality and quantity are compatible. AST has maintained the same high set of quality standards from our first SixPakPlus board, to our 100,000th in less than a year. No one in the industry has set that kind of standard!

Important as it is, quality is just one of the factors that has made SixPakPlus the most popular, most respected multifunction board available today.

Broad performance capabilities is yet another.

SixPakPlus provides users of the IBM PC and XT and their compatibles with an ideal combination of enhancements to give you all these benefits on a single board:

- When you need more memory to run sophisticated software programs and process more data, the SixPakPlus gives you an additional 64K to 384K RAM.
- If you want to add peripherals such as printers, modems, mice, plotters or joysticks, we give you more Input/Output ports — serial, parallel and optional game adapter.
- More convenience, thanks to a built-in clock-calendar that

provides automatic time and date stamping.

- More productivity with SuperPak™ utility diskette including SuperDrive™, PC World's User Survey award-winner, that works like a drive but fifty times faster — and SuperSpool™ so you can print and input at the same time.

Quality even extends to the documentation, making SixPakPlus one of the easiest hardware/software packages to install and operate.

We continue to set the standards by providing the best possible user information. In fact, with our new audio cassette you don't even have to crack our manual to learn how to take full advantage of all SixPakPlus features and functions.

Now meet the standard for multifunction enhancement boards in person. Get a SixPakPlus from a dealer near you — the proven winner for your PC expansion needs. SixPakPlus is a member of the complete AST family of multifunction boards; Micro-to-Mainframe communications, LAN and graphics products.

CIRCLE 101 ON READER SERVICE CARD

EDITOR'S SCREEN

paying for a manufacturer's product testing as well. When a manufacturer calls me to ask, "Did you find any bugs? We'd like to take care of them before the

review comes out," my first, rather mercenary impulse is to ask, "What will you pay me for the service?"

Many manufacturers have been call-

ing PC recently, asking for an outright consultation—and are willing to pay generously for the service. It's become common to walk into editor Bill Machrone's office and see him smiling politely into the phone as he refuses an offer to act as consultant for some highly placed company official.

Tempting Offers

Many of our editors have found that, when they are trying to make a 2-week editorial deadline, a call from a software marketing manager who just wants to take a few (say 60 or so) minutes of their time is singularly inopportune. And then there is the problem of having to constantly deal with what we admit are very tempting offers. It's not that we wouldn't like to make a few extra dollars on the side—but there are such sticky considerations as journalistic integrity. . . .

I don't want to give the impression that software manufacturers must resign themselves to turning out inadequately tested products simply because the staff of *PC Magazine* is not usually available. A tremendous resource, in my opinion, is not adequately exploited—the many hackers who would love to serve as product testers. Although some manufacturers do employ individuals as beta testers, this practice is not as extensive as it should be. Most of the people who review hardware and software for *PC Magazine* do it as much for the simple pleasure of tearing apart a new product as for the check we send. It is hard to imagine that, out of the huge pool of experienced users, manufacturers can't find a few people who, for a reasonable fee, will put a new program through its paces—before it goes out to the customers.

In recent years, businesspeople have talked a great deal about the undesirability of government regulation and the upholding of product standards through industry self-monitoring. Whatever your opinion on that subject, it seems clear that the microcomputer software industry has not set a very good example. ■

AN ORIGINAL: COMBINING FORM AND FUNCTION

INTRODUCING CARRYON: THE STATE-OF-THE-ART NOTEBOOK

Molten's Chariot
Molten Dynasty, 19th Century

CarryOn is a name and address directory that combines the precision and speed of a computer with the ease and comfort of a handsome and portable accessory. The CarryOn package consists of an elegant 5" by 7" leather-simulated binder, high-quality stationery, and directory management software. All for \$35.

CarryOn is a powerful and flexible data organizer. It can add, modify, delete and cross-classify directory entries across twenty different user-defined categories. From "Work" and "Clients" to "Home" and "Entertainment," each separate section can be defined to match your own special needs.

The CarryOn program is menu-driven and self-explanatory. Its screens and User's Guide spell out simplicity and ease of use, and an interactive help message is always one keystroke away.

With CarryOn, you'll no longer worry about losing your directory or having to copy it anew when it wears out. The CarryOn System can print out a whole directory and any of its parts in a matter of minutes, and extra stationery and additional binders may be reordered at any time, directly from CarryOn Systems Corporation.

If your current name and address book can no longer take it—you need the CarryOn System. Once printed and bound, the CarryOn Directory can be used in the home, office, or on the road. You will soon wonder how you carried on without it.

CIRCLE 142 ON READER SERVICE CARD

When Lotus wanted better graphics for 1-2-3, they chose a better graphics card—HERCULES.

And then we became a standard.

When the IBM® PC was introduced over 2 years ago, the talented people at Lotus realized that it was limited by a lack of high resolution graphics. They knew that this was going to have an adverse effect on 1-2-3's graphics. And Lotus didn't want anything to hold back their revolutionary software.

So they turned to Hercules.

Lotus recognized that the Hercules Graphics Card delivered the performance they wanted. It offered high quality text and high resolution graphics on IBM's monochrome display. It completely replaced the IBM monochrome card. And it didn't cost an arm and a leg.

Since then, Hercules has sold a lot of Graphics Cards. So many that the Hercules Graphics Card has become the high resolution standard for the IBM PC. And this means that there is more high resolution graphics software available for Hercules than for any other graphics card you can buy.

Software like Microsoft® Word. Our high resolution makes Word's text much sharper and easier on your eyes. And there are other programs for business graphics, computer aided design, terminal emulation and programming.

Call for our free information kit. See why the company that made the first graphics card for the IBM PC still makes the best.

**Hercules. We're
strong on graphics.

WHAT'S YOUR BEEF?

Do you have to spend too much time getting through all kinds of peripheral matters before you can get into your applications? Do you have to spend too much time on training and retraining of personnel? We plan to eliminate or at least mitigate those and some of your other "BEEFS".

We're here to tell you about SYSTEMATE: WHEN YOU GET SYSTEMATE, you will have fewer "BEEFS" because you can get RIGHT INTO YOUR APPLICATIONS without having to spend so much time figuring out how to make the computer do what you want it to do? And you won't have to remember what to do the next time, because SysteMate does that for you.

We call it SysteMate, because that is what it does—it makes your software and hardware together into an INTEGRATED SYSTEM. The system virtually eliminates the need to know and understand PC-DOS. It will help ORGANIZE your systems and procedures. It is amazingly easy to install and operate. There are extensive context and training support HELP facilities. It provides extensive user definable MENU INSTALLATION functions. It has an unlimited MULTIPLE MENU capability, which means that there is NO LIMIT to the number or type of software you can interface with SysteMate. All PC-DOS software programs, utilities and commands are ONLY A KEY STROKE AWAY!

SysteMate enables Lotus and WordStar, and/or any other combination of applications, to ACCESS COMMON DATA FILES.

IF YOU WANT TO:

- Get right into your applications without having to spend a lot of time getting through all kinds of peripheral start-up procedures
- Eliminate unnecessary time spent on training and retraining your staff about subjects that have nothing to do with your applications
- Organize your computer activities in a systematic way
- Use the computer to increase productivity and profits

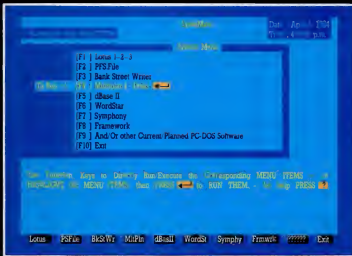

SYSTEMATE IS YOUR ANSWER!

SysteMate features: UNLIMITED NUMBER OF NESTED MENUS, DISKETTE LABELING, LABEL CHECKING PRIOR TO MOUNTING, PRE/POST EXECUTION INSTRUCTIONS, PASSWORDS, AUTHORIZATION CODES, ACCESS CODES, UNIQUE PROGRAM SUBSYSTEM SECURITY LOCKS, AND ONE KEY STROKE ACCESS.

- SYSTEMATE IS AVAILABLE FOR ANY PC-DOS SYSTEM COLOR OR MONOCHROME.
- SYSTEMATE IS IDEAL FOR ANY HARD DISK USER.
- AND IF YOU ARE A DISKETTE USER, AND THINK SYSTEMATE IS PRIMARILY FOR HARD DISK USERS, WAIT UNTIL YOU SEE WHAT IT CAN DO FOR YOU!

SysteMate is now being used by hundreds of major corporations and thousands of individual users!

Computers In the Humanities

Computers and the humanities haven't always been on friendly terms, but computer-aided instruction has much to offer humanistic education in the way of preparation, communication, art, and music.

Rote drill may be the heart of computer-aided instruction, but it's probably not the best way to teach the humanities. Nonetheless, there remains a surprisingly wide scope for the employment of computers in the preliminary stages of humanities education. In the humanities, students and professors strive to discover or create coherent patterns from a body of isolated facts. But students who are to participate in this creative process must first possess at least some of these facts. Computers can contribute significantly to this first step.

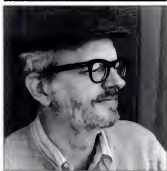

Computers can, for instance, administer a preliminary examination certifying that each student brings enough knowledge and skill to the creative part of humanities study to make the experience worthwhile. To test this, professors might make up a set of multiple-choice questions based on assigned readings. Students could take the test all together at one time or they could use computers on their own and test themselves when they are ready.

Another potential benefit of using computers for objective testing in the humanities is the information that professors and students can glean from the test. Students can quickly see the areas in which they are strong and those that require work. Feedback could help professors recognize patterns of knowledge in a

student to tailor the curriculum accordingly. This feedback will add needed efficiency to the educational process.

Another obvious advantage of the computer is the increased potential for

computer use. New systems will give students the chance to change a composition or arrangement to understand why particular combinations of notes or timbres work while others don't.

Norris S. Hetherington

visual displays. In an art history course, for example, the professor might wish to illustrate the development of perspective during the Renaissance. With new computer graphics systems, students could experiment with perspective by using the computer to draw lines converging on a distant point and then sketch in a picture based on the perspective created. They could then instruct the computer to compare their creations to renderings of actual artistic works of the period.

Music education can also benefit from

Better Access

The humanities traditionally require many textbooks and other assigned readings that are often available only on reserve at the university library. Educational materials stored either on individual disks or on the campus mainframe could be readily accessed at all hours. When students can devote less time to obtaining materials, they have more time to read and discuss them.

Research papers are a basic educational tool in the humanities. Current technology will make it easier for students to work together on their research by allowing them to see drafts of fellow students' efforts and to discuss the merits of different approaches.

Far from isolating students from one another, computers can be expected to facilitate increased student and faculty interaction at a level only dreamed of until now. ■

Norris S. Hetherington is a research associate in the Office for the History of Science and Technology, University of California at Berkeley.

We have built our reputation on offering quality products, prompt service and effective solutions. We understand your need for well-informed people who will work with you to meet your goals. Therefore we have developed a unique approach to sales. Our salespeople are well educated in the computer field and will speak with you not as salespeople, but rather as consultants. They will review your options and suggest alternatives to help you construct a system to best suit both your immediate and future needs. We also have a skilled technical staff that will guide you through any problems you may encounter after receiving your equipment.

NEW!

GAIN SPACE

UNDER CARRIAGE KEYBOARD DRAWER
Model #620 \$54.00

- Turn existing furniture into ergonomic work stations! • Sliding cant-lever drawer (putty color) suspends under desk top, locks in open position • Three keyboard height selections • Fits a work space 3 1/4" (h) x 21" (w) x 15" (d)

VERTICAL CPU STAND
Model #660 \$49.00

- Positions CPU vertically alongside desk • Adjusts to hold CPUs 3 1/4" to 6 1/4" wide • Clear anodized solid aluminum stand
- OPTIONAL: IBM Mono. Monitor/Power Ext. Cables 4 ft. — Model #670 — \$49.00
Keyboard Ext. Cable 6 ft. — Model #680 — \$29.00

ORGANIZE & PROTECT

ROLLTOP 100 DISK FILE™
Model #100 \$36.00

Twice the capacity (100 - 5-1/4" Diskets) of the leading "flip top" file. But it takes no more desk space! An outstanding design that combines contemporary styling with the elegance of a rolltop enclosure and a textured buff plastic body. It includes 10 diskette dividers and anti-skid feet.
Locking Model #100L - \$46.00

GAIN SPACE

KEYBOARD STORAGE DRAWER
Model #610 \$89.00

This is the perfect solution to narrow credenzas or typewriter return locations. The keyboard drawer rolls smoothly on industrial strength ball bearing slides. The drawer locks open for stability and has a built-in wrist rest pad. The 20 gauge metal frame has a baked enamel grey finish with the drawer in putty to match the IBM PC color scheme. Holds any keyboard 2-3/4" (h) x 19-3/4" (w) x 9-1/2" (d)
\$5.00 Shipping / Handling*

PROTECT

DISK DRIVE COVER
Model #310 \$9.00

A cover to protect the IBM PC disk drive area from dust and dirt. Molded in black plastic to match the IBM styling. A vinyl foam seal prevents harmful elements from entering the disk drive area.

KEYBOARD COVER
Model #210 \$10.95

Protect your computer keyboard with our dustcover made from rigid smoked bronze plastic. A low silhouette design that fits keyboards such as the IBM PC and the Keytronic keyboard.

ORGANIZE

EASY-VUE EASEL
Model #410 \$20.00

The ultimate design in a manual easel. Provides desirable viewing angle. Protective pads prevent skidding. 10" x 15" in size, it even properly displays an 8-1/2" x 11" three ring binder. An elegant accessory in smoked bronze, molded from tough durable acrylic.

INCREASE COMFORT

TILT 'N' TURN™
Model #900 \$40.00

LARGE CRT stand fits any CRT with feet separation up to 12" x 12", such as the IBM COLOR or Monochrome Monitor. The Tilt 'N' Turn reduces glare and eye strain and eliminates neck craning. It is made of attractive molded plastic and steel. A compression spring allows completely stable 25° tilt and 360° turn without removing the CRT.

Now available at ComputerLand, Businessland, Software Centres, and at all leading computer and software retailers. Ask your local dealer for our products or order direct from us today.

Letters to PC

Crossed Responses

I had mixed responses to Alfred Poor's recent article on the *Crosstalk XVI* communications program ("Take Your Choice: Two Communications Packages," PC, Volume 3 Number 12). As the semiprofessional owner of Version 3.4, I feel well qualified to comment.

I am sure that Poor's hands-on experience with *Crosstalk* on an IBM PC was careful and extensive. But when I purchased a machine-specific package for my Eagle 1600, it had a problem severe enough to just about preclude its use.

Specifically, whenever a file larger than 1K was uploaded, the light on the disk drive in use would come on and the machine would lock up tight. It would require a cold boot to correct. This meant that uploading a 10-page legal document required approximately 40 individual files, a situation best described as insane.

I made over eight unreturned phone calls to Microstuf, Inc.'s technical support people before they even acknowledged that the problem did, indeed, exist. They advised me that I could correct my problem by returning the original diskette, along with \$20 for the newest version. As my current version was less than a month old, and less than a week old when I first contacted them about my problem, I thought their policy was unfair. They offered to exchange the diskette for free, without the documentation, but said that there were "many new features that I wouldn't be aware of without the new manual." I finally gave in and sent in the diskette and a check.

I received my upgrade 2 weeks later and, less than a week after that, a letter from Microstuf's senior technical representative, Kevin Peterson. He said that my comments about their lack of technical support were correct, but that it was not

their normal way of doing business. He said that, as a result of my situation, their technical support department had been briefed on their policies and the changes made to their *Crosstalk XVI* program. It appears that my upload problems were

inherent only in machines with 128K RAM memory, and that the problem was corrected in Version 3.4. He also included a refund of my \$20.

I was not only mollified by his action, but impressed enough to recommend their product to over half a dozen associates. Unfortunately, I did not have the chance to use the new version after approximately 30 days after its arrival.

Imagine my surprise when I did use it, and found that the problem still existed, and that the recently included XModem features had a tendency to occasionally lock up BBS screens after downloading files. I added another 128K of memory, to no avail.

Maybe the problem is limited to the Eagle version, but I feel that Microstuf shouldn't offer the program with its current errors.

Robert J. Rydeen
Fremont, New Hampshire

Since receiving this letter, PC learned that Rydeen was contacted by Jeffrey Garbers, vice president of product development for Microstuf, Inc. Garbers believes that

Rydeen's problem with *Crosstalk XVI* is a result of a problem in his Eagle 1600's ROM BIOS. Certain versions of the BIOS apparently disrupt interrupt-handling procedures when screen scrolling occurs at the same time as disk I/O and communications processing. Garbers recommended that Rydeen contact Eagle Computer for a ROM upgrade.

At last report, all parties were working to clear up the problem.—Ed.

Cursors! Foiled Again!

As a reader of PC Magazine, I have always found that you are helpful to your readers. I'm hoping you can help me with a problem.

I own an IBM PC with an NEC monitor and have always been bothered by the rapid flickering of the cursor. I know that on some systems, you can set the cursor to blink or to stay on permanently. I have been told that this blinking can be set and changed, but no one that I have asked knows how to do it on the IBM PC.

Do you have a solution? Most users that I have talked to also believe that the rapid blinking contributes to eye fatigue and would like to be able to do something about it, too.

Rodger A. Young
Berkeley, California

IBM's blinking cursor is fixed by the hardware, not by manipulating the control registers on the 6845. The only control you have over the cursor is its vertical size.

IBM's cursor is "opaque," meaning that the character under a block cursor is not displayed in reverse video. As a result, you can see the character only while the cursor is in its "off" state. So it's impractical to turn the cursor blink off.

A number of terminals automatically switch to a slower blink rate when they

LETTERS TO PC

chrome monitor. I can do that on my system because I have an Amdek monitor with the IBM color/graphics card. It is also possible to see the graphics on an IBM monochrome monitor with the Hercules graphics card.

I enjoyed your review of the spreadsheet programs and the advance review of Lotus' *Symphony*. I hope that a mouse used with *Symphony* will cure the annoyance of having the cursor keys on the 10-key pad. That is the big item on my own wish list. It would also help me if Lotus added a stronger reminder to save before exiting.

Barbara Alm Vinson
Mentor, Ohio

Supercomputer Power

I would like to commend Paul Somerson on his article "Supercomputer Power and the PC's Future" (*PC*, Volume 3 Number 9). It is tremendously important to educate the public about supercomputers, their potential applications, and the vast need for researchers and university students to have access to them. Only then will the United States have the trained supercom-

SUPERCOMPUTER POWER & THE PC'S FUTURE

puter users who can go into industry and take advantage of the power available to them through these machines. And as long as this happens, the United States can remain on the forefront of supercomputer technology.

"Thoughtware, How Can I Help My Staff Manage Time More Effectively?"

Thoughtware is new, easy-to-use software that will help you and your staff see and understand how to become better managers. It's a unique series of personal, computer-based management diagnostic and training programs.

Time is a most precious commodity. Once it is lost, it can never be regained. How can you and your employees learn to manage time more effectively? Thoughtware Program 2.6, "Managing Time Effectively," will tell you. This three part program has been designed so that you and all the people in your organization can analyze the use and improve the management of time.

Unit 1 shows how to track the use of time and analyzes how time is currently being spent.

Unit 2 defines and identifies time-wasters. Users respond to on-the-job simulations that alert them to specific ways to use time more effectively.

Unit 3 offers guidelines and suggests techniques which have been used successfully to improve time management skills.

Thoughtware Is The Future.

It's a new way to learn. It will revolutionize management training now, and in the future. Thoughtware utilizes the latest research in this field, and has been tested nationally.

For individuals and their organizations, the educational, economic and operational benefits of Thoughtware's computer-based learning programs are enormous.

Thoughtware Programs run on the following:
IBM® PC and compatibles
with color graphics card.
Apple® II Plus and IIe.

Thoughtware Is The Present.

Here are some of the corporations and organizations that have purchased Thoughtware Programs:

American Express	Hughes Aircraft Co.
AT&T	IBM
Avon	IRS
Bankers Life	Johns Hopkins Univ.
Blue Cross	Levi Strauss
& Blue Shield	Mass. Mutual
Bank of Boston	McGraw-Hill
Bureau of the Census	U.S. Navy

CIRCLE 424 ON READER SERVICE CARD

LETTERS TO PC

Plain Volks," PC, Volume 3 Number 11), I was very interested to see how her assessment compared to mine. I have been using Version 1.2 of *Volkswriter* for about 1 year, primarily for preparing a manuscript with a generous distribution of subscripts, superscripts, underlinings, and computer programs spread throughout the text. I have been very pleased with the speed, simplicity, and power of the program, and after reading a lengthy review of *Volkswriter Deluxe* (provided by Lifetree), I eagerly sent in my \$90 to take advantage of the additional features of the latest version.

After going through the setup process and the on-disk tutorials, I realized that I needed additional memory to avoid file spillover and the potential time penalties and possible loss of portions of my files. I purchased an additional 128K of memory to double my memory size to 256K, and at that point I felt ready to explore new word processing frontiers.

For the most part, the new features in *Volkswriter Deluxe* represent a significant improvement over what I considered to be an already powerful and efficient package. So far, however, I have two complaints. The first is that printing on my IBM graphics printer is approximately one and a half times slower than printing with Version 1.2. I called Lifetree to ask them about this, and I was told that slower printing is the price I have to pay for the ability to use *Deluxe* on a wide variety of printers. I was also told that there is a good possibility that *Deluxe* users who want to recover their previous printing speed may be able to purchase a version of *Deluxe* that can only be used on IBM-compatible printers. I was very disappointed by this response, and a comment to this effect in Pearlman's review would have given potential purchasers of *Deluxe* a chance to consider this feature before making a purchase.

My second complaint concerns the inability of *Deluxe* to display on-screen right justification. Although right justification can be achieved at the time of printing, the inability to examine the effect of

LETTERS TO PC

justification before printing can lead to unexpected printed results and increases the odds of a failure on the part of the user to apply the justification feature to one or more paragraphs in a long text file.

I expect that my appreciation of other *Volkswriter Deluxe* features will overcome my disappointment in these two deficiencies, although I do hope that Life-tree will correct them in future versions. I enjoyed Pearlman's enthusiastic and balanced article, and I look forward to reading more of her work in future issues.

Mario J. Gonzalez, Jr.
San Antonio, Texas

Thumb Print Test

Howard Karten covered all sorts of exotic torture tests in his article about hazards for floppy disks, but he ignored the one that we all worry about most ("Stress Tests for Floppies," *PC*, Volume 3 Number 13). I bet he handled his diskette by the edges as he slipped it into the microwave oven, and he surely kept a gentle grip on one corner of the envelope as he waved it in front of the X-ray machine.

Come on. Tell us about the one that really counts. The laundry machine and the welding cable tests will be great for the TV version of your article, but meanwhile, tell us what happens to your data when you plant a big fat thumbprint right smack on the vinyl.

Joe Rigo
New York, New York

Floppy disks will read over thumbprints with aplomb. It's the abrasive dust that sticks to the grease that ultimately does in the read-write head on the disk drive. Although a dust-contaminated drive can be fixed with any of the commercial drive cleaning kits, you should copy a fingerprinted disk to a new one at the earliest opportunity.—Ed.

Who's Right?

In a sidebar to "PC Passion And Other Romances," author Whitley Streiber is quoted as saying that green monitors dried

PC DEMO

A
Library
of Software
Demo Programs

We're getting noticed.

Hundreds of PC owners now subscribe to **PC-Demo**, the first and only software demo magazine on disk. Each month our subscribers receive:

- ☒ 3 to 5 software demo programs provided by major software publishers.
- ☒ a catalog of more than 100 demo programs that can be ordered individually.
- ☒ a discount coupon worth \$6 off the purchase of software from a leading mail order house.

Our rapidly growing library of software demo programs now includes:

MicroCAD COMPUTER AIDED DESIGN	Omnifile	SEE CORP
Four Point Graphics IMSI	Cdex Training Programs	CDEX
ResQ KEY SOFTWARE	Quickcode	FOX & GELLER
Harvard Project Manager HARVARD SOFTWARE INC	The Next Step	EXECWARE
Prokey ROSESOFT	Concurrent DOS	DIGITAL RESEARCH

STARSHIP VALIANT

Urgent...STARSHIP VALIANT to IBM STARFLEET... Federation under attack... immediate reinforcements imperative... must stop Amdron invaders... only PCjr, PC, and XT crews qualify... best commanders needed without delay, or all is lost... repeat... URGENT... STARSHIP VALIANT to IBM STARFLEET...

StarShip Valiant, which pits IBM commanders against the dreaded Amdron invaders in galactic battle is challenging, yet unusually easy to play. One key stroke summons a superb 98K "Help" system. Another gives a complete command list. A punch-out card, which fits over the keyboard, details all commands and the function key for each.

Friendly as the StarShip Valiant game is, there's nothing friendly about the battles you'll have. StarShip Valiant keeps track of your progress and as you get better, it gets better... faster.

We are so sure of the integrity of StarShip Valiant, a highly sophisticated and extraordinarily friendly strategy game, that we will pay \$40.00 to each person first to document a StarShip Valiant software bug.

StarShip Valiant requires 128K, one disk drive and an 80-column display. Square off with the Amdrons now. Order through your local software dealer or call 800-523-5006, Ext 501, in Pennsylvania 215-265-9390, Ext 501. Price \$39.50 plus \$2.00 Postage and Handling.

Support and Control In Flabby Programs

Norton explains the difference between systems programs and application programs while discussing how programmers gain and lose control of program size.

The terms *systems programming* and *applications programming* are used to describe two widely different kinds of program development. A systems program, such as PC-DOS, typically works closely with the system's hardware. Its purpose is usually to support the general use of the computer. An applications program's relationship to the hardware is more remote; its purpose is usually to accomplish some stated task, such as keeping your checkbook straight.

The fundamental difference between systems programming and applications programming boils down to control versus support. Basically, if you're writing system programs, your goal is to gain control over what goes on while your program is working. If you're writing applications programs, you want support; you need to have things taken care of for you. Examples of support are file control (opening and closing files with a minimum of fuss) and error handling, both of which will free you from a great deal of tedious work and allow you to carry out your main task.

Many programs clearly fall into only one category but, surprisingly, some take on aspects of both. Word processing programs, such as *VolksWriter*, and integrated packages like *1-2-3* usually need to work both ways. For tasks like work-

ing with the display screen and the keyboard and for managing the use of memory, these programs usually strive to assume complete control, without the interference of any supportive and protec-

Peter Norton

tive layer. However, when these programs read and write disk files, they are better off letting standard support subroutines worry about the details, such as finding space for files and recovering gracefully from I/O errors.

Since many programs must work both ways, programmers developing them need a way to determine when they have total control over the computer and when they are being supported by standard subroutines.

If you want to assume total control, you can write your programs in assembly language, which will enable you to get anything out of the computer that is possible. Nothing will get in your way. But if you choose this approach, you will have to tediously take care of every little, complex detail—input and output, handling any errors that occur, in short, deal with the whole mess.

Choosing a language like BASIC is like wrapping yourself in a security blanket of support and high-level services. It can find a file, deal with bad input, paint a color on the screen, or play music—it's all there. The price you'll pay is efficiency; to perform special magic, you'll usually have to break out of that security blanket.

Longing for Control

The people who design programming languages and write compilers for them often ignore this issue, believing that the features and support that the programming language provides are all that you will ever need. While this belief may be justified for some applications, programmers often find themselves chaffing under the rules that their compiler sets up for them. At times, no matter how much you like programming in a high-level language, you may nevertheless long for the extra control and freedom that assem-

Quick. Who

New Microsoft® Chart. Nothing draws conclusions better. Chart gives your IBM® PC presentation-quality business graphics. So you can be sure everyone gets the picture. Quick.

Illustrate your point.

Microsoft Chart helps you set up the chart that most clearly displays your information. Because Chart gives you the freedom to do what you want. Quickly and easily.

Start by picking the chart that makes your point best: line, bar, area, pie, column, high-low, and scatter charts are shown right on the screen. You can see how your information looks in different charts, switching from one to the other on command.

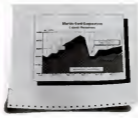

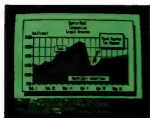

Chart it and print it in minutes.

Exactly what you want. Move any section. Position it, change its size, shape or highlight it. Your chart is displayed on the screen, so you can see how it looks with every change.

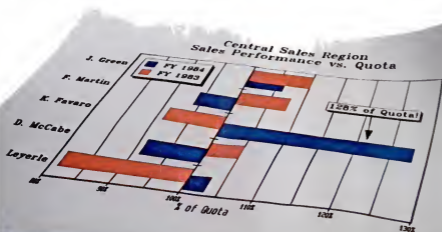

Like it? Print it. Chart works with over 20 printers and more than 10 color plotters.

Chart links with Microsoft Multiplan.®

MICROSOFT
The High Performance Software

TOUCHSTONE 1

New PC power tool; cuts data-entry time in half.

While everyone else is jumping all over the place hunting for numbers one digit at a time, you'll be breezing along, entering whole strings of numbers without even looking...at your TOUCHSTONE 1™ rapid data controller.

Conceived by a financial analyst and PC user...

...Touchstone 1 was designed as a productivity tool for people who enter and revise numeric data...in spreadsheets, accounting systems, inventory control and similar applications. Touchstone means quick answers to important business questions.

The right keys...right at your fingertips...right now

Imagine...\$, %, and () for compound math formulas...without shifting. Separate cursor keys and efficient numeric layout let you forget the NUMLOCK ever existed. The Touchstone 1 has its own enter key, as well as backspace, space, home, period, comma, slash and equals; plus add, subtract, multiply and divide.

Variable performance

The Touchstone 1 has its own internal microprocessor with 16-bit buffer and patented Error Elimination system. Every number ensures positive

entry of every keystroke, even when a previous key has not been fully released.

Quiet full-travel keyswitches are rated for 50 million cycles; contacts are covered by a protective membrane to guard against dirt, dust and accidental spills.

Touchstone 1: Built so well it carries a full, one-year warranty, plus a 15-day money-back guarantee.

Superior ergonomics

Low-profile design meets DIN specs; reduces fatigue and back, neck and eye strain. Heavy-duty case is easily lap-portable, but won't slide around. Standard locating pip on 5 key, helps keep fingers where they belong.

Enter numbers twice as fast

Touchstone 1 data entry takes about 40% of the movement required with the standard PC keyboard. Even more important, you don't have to take the time to look for each digit.

An example; the formula:
(43818x12) + (52x147.3)/(47/12)
Using the standard PC keyboard

(forget the PC number pad unless you can cope with the NUMLOCK), this formula takes 37 keystrokes including 6 shifts, and hand movement totalling 137 inches. With the Touchstone 1 keypad, the same formula is entered with 31 strokes, including NO shifts, and total hand movement of just 57 inches.

A plug-compatible workmate for the IBM PC and XT

Split cable and standard connectors allow you to use the Touchstone 1 alone or side-by-side with the main keyboard. When used together, any key can be entered from either keyboard anytime.

An investment in greater efficiency

Until now, numeric data entry has been the most tedious part of PC operation. If you have better things to do with your time, you really should consider investing in a Touchstone. Only \$189.95. Order by mail or phone for immediate shipment, or ask for it at leading computer stores.

bly language gives you.

We're not talking about the simple use of assembly language subroutines to accomplish things that you can't do in a high-level language, but about gaining at least some control over the level of support that a high-level language gives you. Eliminating support that you don't need can free your program of all kinds of flabby bulk.

There are, depending on how you count them, from two to four ways that compilers add potentially unnecessary support to programs. The first, and one of the most important, is in what is called the prologue, the start-up code that is performed before the program gets down to carrying out the actual instructions we give it.

Some prologue work is absolutely essential. Other work simply sets up the operating framework that is conventional for that particular programming language; a final part of the prologue may set up overhead for input and output that we may never need, which is where the flab lies.

More unnecessary program overhead comes from what I call too-high-level service support. For example, suppose we want to have our program respond to the keyboard in simple ways—say, we need only single-key input. Some compilers may provide enough input support subroutines to perform complex input (where the user can key in an entire line, backspace to make corrections before pressing the Enter key, and so on). In this case, the services we need are comparatively simple, but the subroutines being hauled into our program are complex, adding unneeded bulk.

All in the Name of

In addition, compilers tend to add two other kinds of bulky support (which, to some are simply extensions of those discussed already). Examples include unneeded I/O support and error handling. In cases like this, avalanches occur. Say we have a program that simply reads and

writes a disk file. In order to work with a file, our compiler brings in a generalized file-handling routine that has the ability to cope with file errors. In turn, these routines may need to display error messages, so a display-output routine is brought in, along with a remarkably large set of possible error messages. What we end up with is a heck of a lot of I/O and error support subroutines that our program may not need—all in the name of safe and sound support.

We end up with enormous overhead. If, for example, you create a Pascal program with the IBM Pascal compiler (Version 1), the minimum program size

Choosing a language like BASIC is like wrapping yourself in a security blanket of support and high-level services.

is 18,610 bytes—and that's for a do-nothing program. However, if you dig into the inner workings of a Pascal program, you'll discover that 16,914 bytes or 91 percent of the error-handling and I/O support is completely unused. In short, this compiler produces programs with over 16K of flab.

Although program size doesn't always matter, we ought to have a choice.

Since I've been researching this matter, I've come up with some both remarkable results and useful tips on how to control the flab in your programs. We'll cover that in the next issue. Meanwhile, I'd like to pass along a tip for hard disk users.

Hard Disk Solutions

If you are a hard disk user, do you ever have trouble remembering where you've

put some of your files? Do you sometimes wonder whether you have two copies of certain files stored in different directories? I've found two solutions to the problem of hard disk disorganization, one clumsy and one tidy.

The clumsy one is to let the DOS command CHKDSK generate a list of all the files on your disk and then use your editor or word processor to search for the wanted filenames. If you use the /V option of CHKDSK, CHKDSK will, among other things, display the files on your disk. Then simply redirect that display into a file and your word processor or the DOS FIND command can search for what you want.

If, for example, the file you're looking for is named XXX, type

```
CHKDSK C: /V FIND [ ] 'XXX'
MORE [ ]
```

Unfortunately, this method is painfully slow; it takes over 2 minutes on my hard disk.

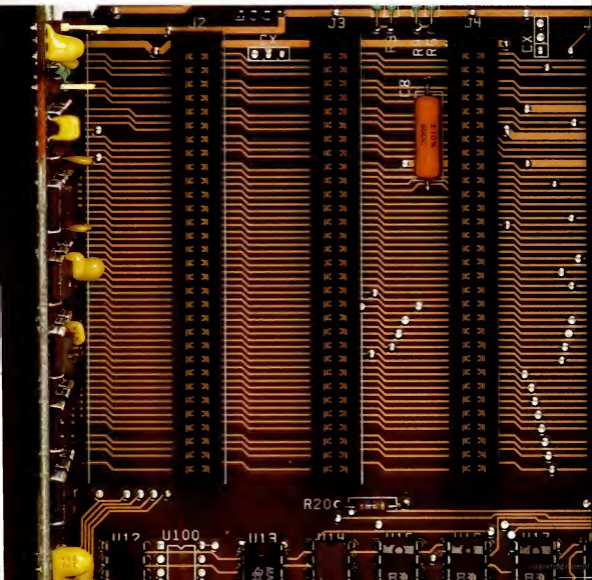

A better solution, called *WHERE*, can help you. The *WHERE* program works much like the DOS command DIR, but it searches through every directory for the file you ask for, which means you'll find every copy, no matter where it's hiding. This handy program is sold for \$19.95 by King Programming Products, P.O. Box 432, Wood Dale, IL 60191.

If you don't have a hard disk, you may be suffering from hard-disk envy. Buying an XT is the high-priced solution. I've tried out several less-expensive add-on hard disks and generally found them wonderful.

My favorite is Maynard's internal hard disk. It spares you the nuisance of another box on your desk, and, best of all, it runs off even the low-grade power supply found in old PCs like mine.

These hard disk add-ons are much cheaper than IBM expansion boxes. The Maynard, for example, is under \$1,000, and others are comparably priced. If you have XT-envy, go for them. ■

**THE MOST IMPORTANT
DECISION YOU WILL MAKE
ABOUT YOUR IBM PC
IS WHAT TO PUT INTO
THESE SLOTS.**

QUADBOARD BRINGS OUT THE BEST.

What you get out of your IBM PC or XT is only as good as what you put in. So put in a Quadboard, the multifunction board guaranteed to bring out the best.

Quadboard was the industry's first multifunction board and its experience shows. It's the most useful enhancement you can make to your system. Quadboard gives your PC power that the others can't.

EXPANDABLE TO
384K

THE SOFTWARE MASTER.

Part of the Quadboard's success is QuadMaster II, the best utility software package around. It's the one that's regularly updated to help you get the most from the Quadboard's features. There's no other combination that offers you more.

And remember, with 10 of the most needed PC functions combined into one board, Quadboard doesn't waste any space. It leaves you with lots of slots free for future expansion.

THE PERFECT "10."

You get all this in the one and only Quadboard:

1. **Memory expansion to 384K** in increments of 64K, with full parity checking standard.
2. A **parallel port** perfect for operating most printers and other parallel devices (addressable as LPT1 or LPT2).
3. A **serial port** (RS-232C adapter) that is software programmable for baud rate, character stop and parity bits. Use it for connecting plotters, modems, letter quality printers and other serial devices.

4. A **game port** for plugging in a joystick or game paddles.
5. An **I/O bracket** that snaps onto the back of your PC to help organize expansion port connectors.
6. A **battery powered chronograph** to keep the system's internal clock/calendar up-to-date.
7. **QuadRAM Drive**, included as part of QuadMaster II software, can be used to set up multiple RAM drives in memory.
8. **MastersPool**, part of QuadMaster II software, can be used to set up a software print buffer.
9. **Qswap**, another feature of QuadMaster II software, lets you change line printers 1 and 2 back and forth as often as you like.

10. **MasterCache** a disk caching system that speeds up any program that frequently reads data from a disk, such as word processors or electronic spreadsheets.

A QUALITY DECISION.

Quadboard is the number one option board for the IBM PC. It's first because it's the best. That means performance, dependability and reliability. It all adds up to Quality, from Quadram. A company you can count on today. And tomorrow.

Before you fill another slot, consider Quadboard by Quadram. It's the best board for the job.

QUADBOARD®

Exploding The Big Wang' Theory.

In the beginning, when office automation was in its primordial stage, there arose from the east wise men bearing computers. Wang. They moved their systems into offices everywhere. And became very powerful.

As office automation flourished, some computers became dedicated to word processing. Processors of words (formerly called typists) became very fast. And very efficient.

Then, something new appeared on the horizon. Microcomputers. IBM® PC's began moving into front offices everywhere. And this made many people nervous.

After all, they'd learned word processing on Wang. They were happy. "Who needs PC's anyway? Get 'em outta here," they grouched. And lo, there was uptightness. And they were plenty sore.

Across the land, MIS directors cried out as one, "Can no one help us?"

We could. And we did. We created MultiMate.™

Enter MultiMate.

Modeled after the Wang word processor, MultiMate was the answer to everybody's problems. For managers who wanted professional word processing for their IBM PC's. For secretaries who'd cut their teeth on Wang and were hesitant about change. Getting started on MultiMate was easy. Like slipping on a pair of fuzzy slippers.

And you know what happened?

People bought MultiMate. Lots of people. It was cheaper than retraining their workforce. Or replacing it. Easier on the nerves too.

The history of office automation may have begun with the big Wang. But MultiMate is the word processor that's making history now.

The End.

The logo for MultiMate, featuring a stylized 'M' with a vertical line through it, followed by the word 'ultimate' in a sans-serif font, with a trademark symbol (TM) to the right.

For more information, or to find the MultiMate dealer nearest you, call Jordan Caswell at 1-800-243-3142.

IBM PC is a registered trademark of International Business Machines Corporation.

Wang is a registered trademark of Wang Laboratories.

Introducing AST-PCnet II.

Now PC networking is as easy as plugging-in your phone.

The advantages of Local Area Networks (LANs) are well known. Existing personal computers can be tied together to share information and expensive peripherals such as disks and printers.

Now AST makes networking easier and more economical than ever before. With AST-

PCnet II, you simply insert the PCnet II board into an I/O slot in your IBM PC or XT. Then connect the PCnet II "twisted-pair" cable to the main network cable using a standard modular "telephone jack."

The same kind of jack that's used on your telephone. To move your

PC from one point to another on the network, simply plug in at the desired location. It's that easy.

With AST-PCnet II, anywhere from 2 to 160 PCs can be interconnected. Standard PC-DOS commands are used to access remote drives and printers. And dedicated file and print servers are not required, because shared PCs also function as standard workstations.

We're AST, the world's leader in communications and enhancement products for the IBM PC. To find out how AST-PCnet II can expand your IBM PCs and

XTs into a reliable, versatile LAN, call or write AST Research, 2121 Alton Avenue, Irvine, California 92714. (714) 863-1333. TWX: 753699ASTR UR

AST-PCnet II is a development of AST Research Inc. Software protocols are based on technology licensed from Orchid Technology Inc.

CIRCLE 104 ON READER SERVICE CARD

Thinking of buying a modem? You owe it to yourself to check

PC212A/1200 includes: Modem Card, PC-TALK III software, card edge guide, modular phone cable, quick reference card, and instruction manual \$299
Optional external serial port connector \$20.

Just a few years ago, computers needed big air-conditioned rooms to operate in, balefuls of money to buy, and a team of wizards to keep them running. The constant march of technological progress has given more and more powerful machines which cost less and less. Desktop computers more powerful than the early mainframe computers are the result of the evolution. The Qubie' modems represent the latest extension of this progress. Because up until now, a 212A compatible modem cost at least \$500. Through the use of four low-cost, state of the art microprocessors, we can now offer two versions of our full featured 212A modem at prices the competition sells 300 baud modems for.

In The Beginning

In September of 1983 we introduced the first 212A

modem card for the IBM PC available for under \$300. The PC212A/1200 is a complete communications package including PC-TALK III software, modular phone cable, card edge guide, and instruction manual. The modem is an auto-dial, auto-answer type, which uses all the Hayes software commands so it can be used with any of the popular software packages including Crosstalk™ and Smartcom™.

We picked the best software package we could find based on it's ease of use and features, PC-TALK III. Our modem includes features the old industry standard missed out on. Like being able to fit in one slot in a Portable PC or PC/XT. Or an optional connector to use the modem's serial port when not using the modem. Of course the topper is the \$299 price, hundreds less than the competition.

Our standalone modem, the 212E/1200 can be used with any computer or terminal with a RS-232C serial port. You can use any Hayes compatible communications software on anything from an Apple to a Zenith. Many owners of IBM PC's are using it because they lack available expansion slots, or have more than one computer they want to use their modem with.

It's attractive gold anodized case houses seven status lights (who says low prices means a shortage of features). It fits comfortably under a standard telephone. It is also a 212A compatible auto-dial, auto-answer modem which supports all Hayes software commands. Even the switch settings are the same, so any software giving recommended switch settings for a Hayes modem can be used, without knowing

Outsider

out the Qubie' 212A modems.

212E/1200 Includes: Standalone modem with cable (specify male or female), modular phone cable, and instruction manual. \$329.

what the switches do. There is a volume control knob for easy adjustment of the speaker's output. Included in the package is modular phone cable, a cable to hook it to your computer or terminal, and instruction manual. Choose the communications package right for your needs, and you're ready to go!

Four Hearts

The heart of the Qubie' modems are four digital signal microprocessors. Two handle sending, and two do the receiving. Rather than attempt to filter all but the relevant tones used for modem communications, the microprocessors measure the tones digitally. This allows them to overcome line noise and static better than analog filter based modems.

Why Buy From Qubie'

Because you will get a prod-

uct as good or better than any available, pay less for it, and get factory direct help if you need it. If at any time during the one year warranty period your modem should require service, we will fix it or replace it within 48 hours.

Notice also there are no hidden charges in our prices. No extra for freight, insurance, credit cards, or COD fees. In a hurry? UPS 2nd day air service is just \$5 extra. If you are like many who say, "Nah, it's too good to be true," just apply the acid test and find out. Then you will be asking yourself, "Why should I pay what these modems used to cost?"

The Acid Test

Qubie' gives you a 30 day satisfaction guarantee on your modem. If you are not completely satisfied we will refund the entire amount of your purchase including the postage to

return it. If you can, get anyone selling another modem to give you the same guarantee. Buy both, and return the one you don't like. We know which one you will keep.

(IBM is a trademark of International Business Machines Corporation. Crenshaw is a registered trademark of Microsoft Inc. PC Tech II is a registered trademark of The Newhouse Press Inc.)

Order Today, Shipped Tomorrow!

All prices include UPS surface freight and insurance. Add \$5 for two day air service. For fastest delivery send certified check or credit card. Personal checks take 18 days to clear. Calif. residents add 6% sales tax. Corporations and Institutions call for purchase order details.

We called in 19 of the most popular PC word processors for a command performance. All knew their lines, but we've separated the stars from the understudies.

THE ON WORD

The number of word processing systems on the market today is staggering. Any businessperson, writer, or home computer user who wants to purchase a program for producing reports, articles, or letters must wade through a bewildering flood of software that ranges from extremely simple, menu-driven word processors to complex systems that are practically programming languages in themselves.

To help our readers sort through this cornucopia of word processing software, we gathered and extensively tested 19 of the most popular programs on the market today.

As you can readily see as you look through the following pages, we have not simply reviewed each software package on its own individual merits. Instead, we established 13 separate word process-

WORD PROCESSORS

ing functions that we felt should be included with any usable word processor: loading the file, calling up help screens, entering data, adaptation to the IBM PC, text adjustment, search and replace, block moves, paragraph formatting, saving the file, printing the file, error handling, exiting the program, and "Bells and Whistles," a section that also includes the writers' opinions of the software.

Each of the ten writers chosen to participate in the project was given a somewhat altered version of the Gettysburg address in an ASCII file labeled GETTYSBU.RG. He or she was instructed to use the assigned software to edit and reformat the file. In order to ensure that each program was tested following exactly the same criteria, the writers were given a "script"—a precise list of instructions to follow that would test the capabilities of each word processing package.

The following pages will examine exactly how these functions operate with each word processor. We begin each section with a short explanation of what we asked the reviewers to do. Each reviewer explains how that particular function was performed with each word processor.

On each opposing page is a chart that breaks down each of these word processing functions even further, so that you can easily discover the capabilities and limits of each system.

We hope that the following information will make it easier for you to break through the chaos and discover what you can expect from a word processor and which of the packages reviewed here is most likely to suit your needs.—**Barbara Krasnoff**

Note: The names of our ten reviewers appear with the product IDs in the sidebar at the end of the article.

Start up the word processor. Load in the ASCII file called GETTYSBU.RG. If the word processor objects to the name, change it. If the product cannot edit ASCII files, try to alter it so that it is acceptable.

Bank Street Writer

After showing the logo and copyright, the screen appears ready for writing. To load an existing file, press Esc to bring up the Edit mode, select Retrieve from the command menu, and the file comes up (minus its extension).

EasyWriter II

EasyWriter II loads automatically and displays a nine-item main menu that offers you options to edit a document, open a "file folder," delete a document, print, paginate (reformat) a document, set the date (*EasyWriter II* is oblivious to the DOS system date), print a document list, access system functions, and access extended functions (such as the optional *EasyMailer II*). The file folder—a single DOS file containing as many as 100 documents—is the heart of *EasyWriter II*. (Each document would be a separate file in most other systems.) The menu for each file folder offers a line of information about each of the first 12 documents, with document number, a 30-character document description, number of pages, author's initials, operator's initials, document creation date, and update date. To see the 88 other possible documents, the user must print the document list (a main menu option).

To edit a document, first open a file folder and then choose the Edit option and pick a document number, which brings an existing document on-screen or creates a new document. An ASCII file created outside *EasyWriter II* must first be imported. (Import is one of the system functions.) The ASCII file is read in as formatted, but it is stripped of carriage returns.

FinalWord

The program is started by typing FW at the DOS prompt and hitting the Enter key. It loads in about 7 seconds. Initial start-up

BANK STREET WRITER

The editing screen for *Bank Street Writer*. Functions are chosen by moving the highlight through the command line on top.

immediately puts you back into the document you were working on when you last exited the program, with the cursor exactly where it was at the end of that session.

To load in the ASCII file hit Ctrl-F4, which is the FIND FILE command. *FinalWord* will prompt you to enter a filename, and the file will be read into a buffer. An alternative is to call up a disk directory, put the cursor under the name of the file you want to edit, and hit F (for Find).

Loading Edge

An ASCII file is loaded by choosing the Utilities option from the main menu and then choosing the Convert from ASCII option. *Leading Edge* asks for the name of the ASCII file and the name you want to use. Go into the program. You are asked to choose your "folder," each of which has its own format. When you pick your folder, the program displays the files in that folder, and you can use the arrow keys to choose the file you want.

Microsoft Word

Word can be started by typing WORD from DOS with an optional filename (to continue editing an existing file) in an optional switch (/L, /C, or /H). Switch /L

starts *Word* immediately with the last document loaded. Switch /C starts *Word* with color instead of high-resolution monochrome graphics. Switch /H starts up with a 90-character by 43-line display if the computer is equipped with a Hercules GraphicsCard.

To load GETTYSBU.RG, select in sequence (either manually or with the mouse) the commands TRANSFER, FILE, and LOAD and answer the prompt for a filename.

MultiMate

To load an ASCII file, insert the Utility disk and type FILECONV at the prompt to get a menu of file conversions. You then follow simple prompts. You bring up the main menu by typing WP and hitting I and the Return key—this brings up a summary screen of all files on the disk. Type in which file you want, hit F10, and the file appears.

Palantir

The start-up screen shows a menu of the major functions for editing, saving, printing, and help. It also shows the status of the disk drives and the currently edited file.

(continues on page 150)

Program	Does Help supplant manual?	On-line Help facility?	Text file of information?	Adjustable amount of help?
BANK STREET WRITER	YES	Yes, limited	NO	NO
EASYWRITER II	Somewhat	YES	YES	NO
FINALWORD	NO	YES	NO	YES
LEADING EDGE	Yes, after installation	YES	YES	NO
MICROSOFT WORD	YES	YES	YES	YES
MULTIMATE	YES	YES	NO	YES
PALANTIR	NO	YES	NO	YES
PC-WRITE	NO	YES	NO	NO
PERFECT WRITER	YES	YES	YES	YES
PFS:WRITE	YES	YES	YES	NO
READIWRITER	NO	YES	NO	NO
SAMNA WORD III	YES	YES	YES	YES
SELECT BILINGUAL	YES	YES	NO	NO
SPELLBINDER	YES	YES	YES	NO
VOLKSWRITER	NO	Yes, minimal	NO	YES
WORDMARC	NO	No, but good prompting	NO	YES
WORDPERFECT	YES	YES	YES	YES
WORDSTAR	YES	YES	YES	YES
XYWRITE II-PLUS	NO	YES	YES	NO

Bring up on the screen any initial help information, including a directory of the diskette, if possible.

☐ **Bank Street Writer**

Most users will be able to use *Bank Street Writer* without referring to the manual at all. Alt-K brings up an on-screen drawing of the most frequently used keys, but the program is so simple that help is usually not necessary.

☐ **EasyWriter II**

F2 provides help on the menu choices. Once at the Help screen, pressing almost any valid *EasyWriter II* command key displays an explanation of what the key does. Most commands use the function keys, either alone or with the Shift or Alt key depressed.

EasyWriter II accepts any filename but can't follow a DOS 2.0/2.1 subdirectory path. You have to know the filename before starting, since there's no way to get a directory of a disk. This is a recurring problem: In situations where you need to call or work with another document, *EasyWriter II* should but can't list available documents.

☐ **FinalWord**

FinalWord offers general help information. Help is called up in connection with a specific command about which you may need more information. A disk directory can be called up by pressing Ctrl-F2, specifying the drive, and pressing the Enter key.

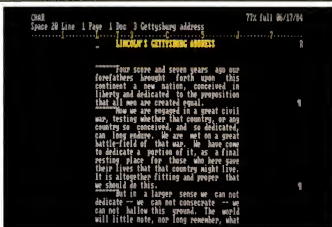

☐ **Loading Edge**

To call the on-line Help facility, you hit F1 followed by the key assignment you want more information on.

☐ **Microsoft Word**

All normal functions are well documented on-line. Available commands are always listed in the four-line command area at the bottom of the screen. Help is available at key level. Whenever input is needed, you can type H or place the mouse arrow over a question mark to generate help that entry or for any other operation.

EASYWRITER II

The editing screen for *EasyWriter II*. Each document is contained in a DOS "file folder" that includes as many as 100 documents.

☐ **MultiMate**

It would be possible to learn *MultiMate* by following its logical organization and by using the Help facility, which is called up by pressing Shift-F1. To learn about a specific function, press that key while in Help mode.

To bring up a summary screen of all files on the data disk, select the EDIT, CREATE, or PRINT utilities from the main menu and press the Return key.

☐ **Palantir**

To call up the Help menu, you type H from the main menu. However, even if you study the help screens, you'll probably have to use the manual often.

☐ **PC-Write**

When you press F1 for help, you get a screen that lists all of the commands. First you see a brief summary of all the major commands. Then, by pressing the right-arrow key, you can call up more extensive paragraphs telling you, for example, how to move a block of copy. There is no way, however, to read the Help menu while editing, and finding precise information takes a bit more reading than usual.

To see a directory of files, you must type DIR while in DOS.

☐ **Perfect Writer**

On-screen help is available at any point in the program. Strike Esc to toggle the main menu on and off and proceed through the menu chain until the desired function is found. Place the highlighted bar over the item and type a question mark. A description of the function appears. Hit Esc again to return to editing.

For a disk directory listing, choose the Directory function for the Document sub-menu and specify the drive.

☐ **PFS:WRITE**

If you need help at any time, press F1. At the main menu, the Help screen explains the six menu options. While entering text, the Help screen explains the 10 function keys that control editing commands. Pressing F10 dissolves the Help screen and returns you to what you were doing. The amount of help that's given is fixed at one screenful.

☐ **ReadiWriter**

Pressing F1 gives you a screenful of help information, most of it concerning *ReadiWriter's* key usage. However, help information won't be necessary once you know the program.

(continues on page 151)

Program	Imports standard ASCII files?	Restrictions on file specs?	Name extension refers to file type?	Can specify a DOS subdirectory?

Briefly describe the initial edit screen. Position yourself at the end of the file and enter: "4 score and seven years ago our forefathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all people are created equal."

□ Bank Street Writer

There is a 5- by 8-inch box in which the copy stands. Above this box are two function lines. Below it is a status line that gives information such as "Data disk in drive B:" and "Press Alt-K for Keys." You choose which function you want by pressing Tab. When the function is highlighted in reverse video, you press Return.

□ EasyWriter II

EasyWriter II divides documents into pages, or what will eventually become pages in the finished product, of up to about 4,000 characters each (a single-spaced, typed page has about 3,500 characters). Each *EasyWriter II* page is treated as a separate, fiercely independent fiefdom. Only with special commands can text from adjacent pages be blended together. Once in the Edit mode, the screen displays three status lines containing the document name, the cursor location, the date (if set), the percentage of the disk that is full, a ruler/tab stops line, any fonts in effect at the cursor location (such as underline, boldface, double-underline, super/subscript), and the current editing mode. Text is on the bottom 22 lines.

□ FinalWord

FinalWord is designed to edit documents in one of 12 "buffers." These buffers are segments of a *FinalWord* program file on disk, called the SWAP file. This file can be as small as 64K or as large as 180K, depending on what other programs you choose to put on the *FinalWord* program disk and how much disk space you have. Buffers can be created and deleted without changing the size or configuration of the SWAP file. You may find that very long documents will not fit into a SWAP file

FINALWORD

```

Pstyle(spacing 3 lines),
Ppagefooting(),
Pcenter(P(LINCOLN'S GETTYSBURGH ADDRESS))

```

Four score and seven years ago our fathers brought forth on this continent a new nation conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting-place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But, in a larger sense, we cannot dedicate, we cannot hallow this ground. The brave men, living and dead, who struggled here have consecrated it, far above our poor power to add or detract.

The editing screen for *FinalWord*. As text is edited in a buffer, the changes are constantly being written out to disk.

buffer unless you delete some of the other buffers. The maximum length of a document you can edit is therefore something less than the size of the SWAP file, though several such documents can be chained together for printing. As you edit a document in a buffer, the changes are constantly written out to disk—a "virtual memory" scheme that protects your text should there be a power failure.

Once you have created your SWAP file, you can begin entering data. The next-to-last line of the screen is in reverse video. It contains information on the file currently being edited.

□ Leading Edge

The editing screen contains lines on top indicating document name, page, line, column, date, time, and Insert or Overtyping mode. There is also a ruler line that shows the margins. Editing is done on-screen using the function keys, Shift, Alt, and Ctrl.

□ Microsoft Word

The initial screen includes a windowed workspace and a four-line area at the bottom for prompts, suggested responses, and help messages.

Available commands are always listed

in this four-line area, and you call them by placing the mouse arrow over the command and pushing the left button or by entering the Command mode by pressing Esc. Then type the first letter of the command you want. Alternatively, the Tab and spacebars can be used to highlight commands sequentially. The command is invoked by pressing Return when a command is highlighted.

□ MultiMate

The document name, page number, line number, and column number appear at the top of the screen, along with a permanent ruler line that shows the spacing and tabs. At the bottom right, S ↓ and N ↓ indicate that CapsLock and NumLock, respectively, are off; up arrows indicate they are on. When you use a function such as Delete, a highlighted prompt appears at the top right.

□ Palantir

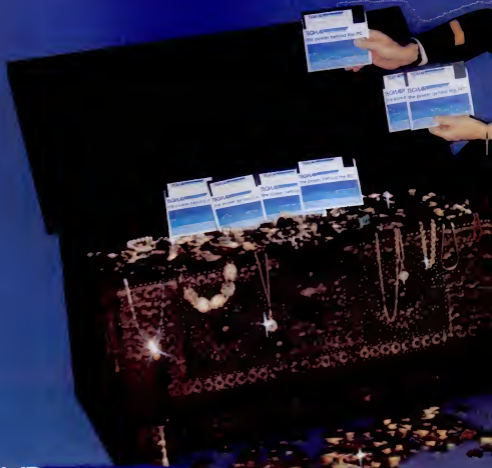

The initial Edit screen is blank except for a status line and a ruler line. The status line indicates the current scrolling direction, the current page, line, and column numbers, and either the word *Change* or *Insert* to indicate data-entry mode.

Treasure Chest of Software

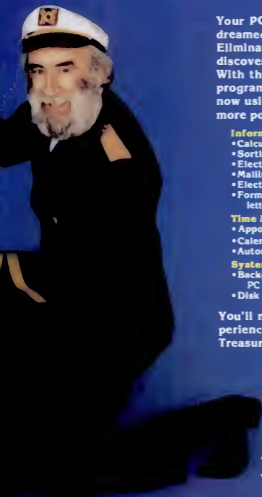

jrCaptain™ and 1stMATE™

TECMAR

the power behind the PC™

with Tecmar's CaptainTM, multifunction boards

Your PC can finally do all those wonderful things you've dreamed about — with the Treasure Chest of Software. Eliminate the need for many desk top accessories when you discover Tecmar's new easy to use software technology. With the press of a key you access many Treasure Chest programs without having to exit from a program you are now using. This Treasure Chest of Software gives your PC more power for:

Information Management

- Calculator
- Sorting Program
- Electronic Rolodex*
- Mailing List
- Electronic Notepad
- Forms Generator - create letters, labels & reports

Time Management

- Appointment Alert
- Calendar Generator
- Automatic Time and Date

System Improvements

- Background Printing - frees PC for other work
- Disk Simulator in RAM

Hardware Diagnostics

- Memory Diagnostics
- Printer Diagnostics
- Clock-Calendar Diagnostics

Information Security

- Confidential File Coding

Use at Home

- Checkbook Balancer
- Inventory Management
- Banner Generator - prints letters 4.5 inches tall
- Tic-Tac-Toe
- and more !

INTRODUCTORY OFFER

*Rolodex is a trademark of The Rolodex Corp.

You'll never want to turn your computer off once you experience the ease of use, efficiency and enjoyment of the Treasure Chest of Software.

For the IBM PC: Captain & 1stMATE

- 0 to 384 KBytes of Memory on the Captain Board
- 0 to 256 KBytes of Memory on the 1stMATE Board
- Clock-Calendar with battery
- Serial Communications Port
- Parallel Printer Port
- Treasure Chest of Software

for the PCjr: the JrCaptain

- 0 to 128 KBytes of Memory
- Upgrade to 512 KBytes with addition of JrCadet Board
- Clock-Calendar with battery
- Parallel Printer Port
- Treasure Chest of Software

CIRCLE 501 ON READER SERVICE CARD

Does the program make efficient use of the PC and PC keyboard? Also, if appropriate, note the program's use of color for highlighting.

☐ Bank Street Writer

None of the function keys is used, but you can program them with your own character string of up to 45 characters. The string is then automatically inserted into the text when the key is pressed. Otherwise, considering the simplicity of the program, the keys are used well.

☐ EasyWriter II

One of *EasyWriter II*'s strongest points is its use of the PC keyboard. Most every editing task is done with a function key alone or in combination with the Shift or Alt keys, the Esc key (to save text and move back to the main menu, or back up a step in submenus), the Ins and Del keys, and the cursor pad. A minor criticism: The 2- x 12-inch keyboard sticker explaining functions and fonts is arranged alphabetically, while modes are arranged in ascending function key order. Better they should both be one way or the other.

☐ FinalWord

FinalWord lets you attach any command in the entire program to virtually any key on the keyboard. You can thus establish the keystroke sequences that make the most sense to you and best allow you to run this powerful program.

☐ Leading Edge

The program makes efficient use of the keyboard. Hitting F5 leads to a submenu that allows you to choose colors for the display.

☐ Microsoft Word

The function keys, Alt key, and keypad keys are all used in a logical way. Stick-on markers are provided for special keys.

☐ MultiMate

The program is logical and easy to use. There is one "patch" to change the color of the status lines. To edit the extended character set, hold down Alt and type in

LEADING EDGE

The editing screen for *Leading Edge*. In order to execute a command, you must use the plus sign key rather than the Return key.

the 3-digit numerical code that corresponds to the character you want.

☐ Palantir

The availability of ten function keys was taken into account early in the design phase of *Palantir*. Not only are they powerful, but they are placed in a pleasantly symmetrical and easy-to-remember way.

☐ PC-Write

My impression is that *PC-Write* is well adapted to the PC. Moving your hands on the keys is easy, for they are intelligently placed. With practice, most moves become intuitive.

Also, the function keys are assigned well—for example, F6, which is used to mark text for moving, copying, and deleting is handy to reach. You can also change any keys you like. There is a source diskette that makes this program a programmer's paradise. You can even change keys so that much of *PC-Write* will emulate your current word processor.

☐ Perfect Writer

One of *Perfect Writer*'s annoying defects is that it makes poor use of the function keys, often assigning them trivial or peculiar commands instead of complex execu-

tions that are tedious to do with the menus.

☐ PFS:WRITE

PFS:WRITE is written specifically for the PC and its clones. Everything is done by the function keys alone or in combination with the Shift key, or through the cursor pad. Although the Ctrl key is never used, some sequences do funny things to the copy, such as Ctrl-E, which deletes a line. Esc always returns you to the main menu. On a color monitor, underlined and boldfaced words are in separate colors; on the monochrome monitor, they're underlined and boldfaced.

☐ Read!Writer

Read!Edit, the editing subset of this word processor, is well adapted to the PC. The function keys are used well, and the functions of the control keys are related to their names.

☐ SamnaWord III

Samna gives you ten different keyboard options (including French, Spanish, and Greek) that make use of the extended ASCII set. For example, once you set the keyboard to behave like a German type-

(continues on page 159)

Program	Uses PC keyboard efficiently?	Uses color screen?	Colors can be tailored?	Can edit extended character set?
BANK STREET WRITER	YES	YES	NO	NO
EASYWRITER II	YES	YES	NO	NO
FINALWORD	YES	YES	NO	NO
LEADING EDGE	YES	YES	YES	NO
MICROSOFT WORD	YES	YES	YES	YES
MULTIMATE	YES	YES	Only status lines	YES
PALANTIR	YES	YES	NO	NO
PC-WRITE	YES	YES	YES	YES
PERFECT WRITER	Adequate	YES	YES	NO
PFS:WRITE	YES	YES	NO	NO
READIWRITER	YES	YES	NO	YES
SAMNA WORD III	YES	YES	YES	YES
SELECT BILINGUAL	NO	YES	NO	YES
SPELLBINDER	YES	Needs tech manual	Not easily	NO
VOLKSWRITER	YES	YES	YES	YES
WORDMARC	YES	YES	NO	YES
WORDPERFECT	YES	YES	YES	YES
WORDSTAR	YES	YES	YES	NO
XYWRITE II-PLUS	YES	YES	YES	YES

Position the cursor to the first "4" in the paragraph you added to the end of the file and replace it with F. Insert the word our after H. Center the heading of the document. Indicate to the word processor that the heading should be underlined and printed in boldface.

□ Bank Street Writer

The cursor is positioned with the four arrow keys. Simultaneously pressing Ctrl and an arrow key moves the cursor to the beginning or end of a line. Press Home and End to get to the top and bottom of a file. Alt-C centers type, Alt-U underlines, and Alt-B boldfaces.

□ EasyWriter II

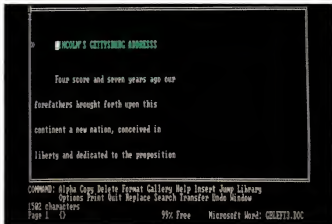

EasyWriter II is always in the Overtyping (or replace) typing mode. To insert text, pick a mode, press Ins, and *EasyWriter II* inserts blank spaces accordingly. Then type in the additional text. Extra blank space remains until you press the Adjust (paragraph reform) key (F8). Cursor movement is always possible by using the cursor keypad or by choosing a mode and hitting the Previous (F9) or Next (F10) keys. To jump between pages, choose the Page mode and Previous or Next, or Go To (F10), and a page number. When leaving a page, all changes are written to disk, and the new page is read from disk into RAM. Pressing Home in combination with a cursor key moves the cursor to the edges of the screen. PgUp and PgDn move screenfuls within a page, but not between pages. There is no easy way to go to the end of the document; if you know the number of pages, you can go to the top of the last page.

Centering is easy: Press Alt-F2. To underline press Alt-_, and to boldface (actually doublestrike), press Alt-B. Both show up on screen. The mode you are working in controls how much text is underlined or boldfaced. For example, in the Sentence mode, the whole sentence is affected.

□ FinalWord

FinalWord uses single commands to move

MICROSOFT WORD

The editing screen for *Microsoft Word*. The command line can be accessed using either a mouse or the computer keyboard.

the cursor forward or backwards by character, word, sentence, line (at the edge of the screen), line (up or down), paragraph, or document. These commands can be bound to virtually any key you choose.

The cursor movement commands are also used to indicate text for deletion, copying, and capitalization. For example, hitting F6 moves the cursor to the end of the next sentence. Hitting F7 (which turns on the Deletion mode) and then F6 deletes the next sentence (and turns off the Deletion mode).

During the initial configuration of the program you have to choose whether highlighted text will print as boldface, italicized, or underlined type. Unfortunately, you can't get a combination of these. To highlight text as you type it, toggle the Highlight mode off and on with the F10 function key. While this mode is on, the letter H appears in the data line on the screen, and the text you type will appear underlined.

In order to highlight text that is already on screen, press the Alt-F2 key combination and then indicate the amount of text to be highlighted.

In order to make text print out both underlined and in boldface type, you would have to use one of the embedded

commands and go through the advanced formatting procedures. The embedded command would look like this:

@p(Lincoln's Gettysburg Address)

□ Leading Edge

The program moves the cursor to the top and bottom of files using Ctrl-Home and Ctrl-End. It can move the cursor to the beginning and end of files, left/right by word, up/down to previous/next punctuation, end of page, next page, and selected page numbers. It has five "bookmarks" that can be placed at will. To center, put cursor on line then type F6. To underline and boldface, hit F5 for Attribute submenu and mark text with cursor.

□ Microsoft Word

Position the cursor on the 4 and type the word *four*, then forward delete to get rid of the 4. (The program will default to the Insert mode.)

Press Ctrl-PgUp to get to the top of the document and type: Lincoln's Gettysburg Address, followed by two carriage returns. To center, put the cursor on the appropriate line and hit Ctrl-C. Shift-F9 (continues on page 159)

Program	Default editing mode (insert or replace)	Underlines?	Boldfaces?	Centers individual lines?	Adjusts more than one line at once?
BANK STREET WRITER	Replace	YES	YES	YES	NO

PC BRAND™ HAS UNBEATABLE

C has rapidly become the language of choice for serious software developers. The language of maximum portability across the spectrum of today's personal computers. The language which will most rapidly adapt to tomorrow's machines. The companion language to Unix™, the operating system destined for predominance. Major companies such as Microsoft and Micropro know this. They have switched to C for their applications development. How ready are you for the future?

PC Brand has the complete line of today's finest professional C tools. Not just the finest compiler, but libraries for graphics and screen design, overlay linkers, and program editors acclaimed as the best of their kind. It is a complete workshop of craftsman's tools which will turn you into a C professional in a hurry; capital equipment which will pay back your investment many times over.

Take the time to read this advertisement. You are sure to see the competitive edge these products will deliver.

HALO

A Spectacular Graphics Extension to Lattice C

PMATE

The Programmer's Word Processor

Pmate was designed for programmers. We'll wager that you cannot find a programmer who has discovered Pmate and moved on to something else.

Pmate is a full screen editor with ten auxiliary buffers for squirreling away pieces of text until needed. It uses single key commands to move the cursor, or text, or insert or delete, or rescue several thousand characters of deleted text.

It has a format mode for tab setting or wraparound and shaping when it's time to write documentation. Pmate lets you assign chains of commands or strings of text to single keys: one keystroke could set up the entire shell of a new C function, for example.

Pmate has variables, if-then statements, loops. It calculates, and converts decimal to hex to binary and back. You can write compact programs (called "macros") to delete comments, for example, or check syntax, or process long sequences of commands. Macros can alphabetize lists, do row and column math, perform a series of operations on multiple files, even summon other macros.

Put another way, Pmate is a text editor with its own built-in interpretive language. A language you can use to completely customize this text editor to your fancy. Possibly the most artful, ingenious program you have ever seen.

LATTICE C

The Preeminent 16-bit C Compiler

You can find a more economic way to learn C, but if your interest is program development, Lattice C™ is the unparalleled choice. Byte said "the Lattice C compiler produces remarkable code . . . outstanding in terms of both execution speed and code compactness". After reviewing nine compilers for the PC, the *PC Tech Journal* unequivocally declared Lattice C "best for software development. . . it compiles fast and produces fast programs".

Lattice C is a full implementation of Kernighan and Ritchie, not a subset, and even offers extra features such as nested comments, 39-character variable names and extra compile time checks for some of C's subtler errors. The compiler comes with a full library of I/O routines which implement under MS™ DOS most of the Unix-compatible standards described by Kernighan and Ritchie.

Halo™ will astound you. It provides a complete library of graphic functions which can be linked with your Lattice programs to create full-color charts, graphs, simulations, even animation.

Over 100 commands are at your disposal, including plot, line, arc, box, circle, plus single commands to produce bar graphs and pie charts. Pattern-fill and dithering commands give your graphics impressive texture and color mixes, rubber-banding draws shapes for interactive users, area moves produce animation, fill and flood commands paint areas. The newest version allows you to define your own world coordinate scheme, divide the screen into "viewports" (windows), and scale graphic figures automatically.

It's a long list of capabilities which make for an extraordinarily powerful product. In fact, Halo is so good that manufacturers of graphics boards and systems are adopting it as a standard graphics language. So it can bridge your application to other systems. CAD-CAM developers, especially, have embraced its device-independent approach for maximal portability.

Halo is a dazzling demonstration of why C has become the language of choice among programming professionals: its function library architecture means you can tremendously enhance your firepower by acquiring libraries of software like Halo with dramatic economy of time and money.

Requires IBM monochrome or color graphics card or equivalents.

Lattice C runs on virtually any computer using an 8086 or 8088 microprocessor, and we carry two versions for either PC-DOS™ or CP/M-86™. Create your source files with any word processor or text editor like Edlin or our Pmate™ and Lattice C will compile them into Intel 8086 object module format ready for linking with other modules by linkers such as DOS' Link or our Plink86™.

Lattice C offers a choice of four memory models which allow the program designer to choose the right combination of efficiency and size for an application: a range between 64K and a full megabyte for program and data area size.

The documentation, which Byte says "sets such a high standard of excellence that others don't even come close", features sample source programs and covers the interface to assembly language and machine dependencies.

C's structured approach encourages development of tight, fail-safe functions which can be counted on to return reliable results every time. Local variables unknown outside of functions to safeguard against collision. Extremely powerful nested expressions which produce elegant, concise code.

Requires 128K RAM.

PLINK86

Overlay Linkage to Expand

Software is becoming ever more sophisticated, which means more complex programs requiring large chunks of memory. But if you use extra memory, if you count on users to have expanded RAM, you will forego sales to those who do not.

Plink86 is the answer. It takes on the job of shoe-horning large programs into small memory. First, Plink86 acts as an alternative to DOS' Link. For a language like C which encourages design of separately compiled object modules in the Microsoft relocatable format, Plink86 pulls modules together into single compiled programs. But Plink86's overlay power is what has gained it a reputation as a miracle worker. It binds into the compiled program its overlay manager which knows how to swap modules of your large linked program between disk and memory, so that each can temporarily occupy the same memory space.

Unlike other linkers, the overlay manager acts on its own, needing no calls from the source program. Instead, Plink86's straightforward overlay description language allows you to describe your overlay structure in one place in your program — a structure

C-FOOD SMORGASBORD

A Menu of Difficult to Prepare C Functions

C is a language of function libraries: sturdy routines which your application can effortlessly reference to get the job done. But someone has to write them. It would take months to concoct and perfect the complex and useful servings which have been prepared for you and thoroughly tested in C Food Smorgasbord™.

Decimal Arithmetic: Functions to perform operations on binary-coded decimal (BCD) numbers of up to sixteen significant digits. Includes trigonometric and logarithmic functions, powers, conversions to strings, and much more.

Level 0 I/O Functions: Enable you to perform direct I/O operations for screen, keyboard, printer, and asynchronous port with no dependence on higher I/O functions to minimize memory usage and maximize speed.

IBM™ PC BIOS Interface Access: Allows you to get at the basic I/O services in the ROM BIOS not available through the normal operating system to get and set the video mode, cursor position, color and screen attributes,

keyboard shift, scrolling, printer channel and port status.

TIP, the terminal independence package: Lets you easily move programs to computers with different types of terminals.

There is a basket of delicacies beyond this brief list; a cornucopia to sample, any one of which will save valuable time and pay back far more than C-Food Smorgasbord's overall price.

PANEL

Are You Still Coding Hand-Made Data Entry Screens?

Designing custom screens is intricate, time-consuming, and costly. It can make you the loser in competitive bidding. It can add weeks, even months to bringing your product to market.

But not when you use Panel™. Put Panel to work and you hire a superprogrammer for the minimum wage. Telling Panel your screen design is like using a word processor. You can add, move, copy, delete, and reshape fields with single key commands. The result? Finished C program code with field descriptors, color and highlighting, input editing by type of field, help keys, and warning messages.

Panel can also create a terminal selection program customized for your application, and gives you a utility to quickly test your finished screens. It even includes a multi-key data file maintenance program which interacts with the screen you design. All the tools you need to generate code for the trickier aspects of your application, or even to create stand alone data entry and retrieval products without any programming.

Panel routines are powerful. Unlike so many programs which make error correction difficult once a field is departed, Panel gives the user full field-

to-field movement for editing, and overtype or insert/delete within fields.

A truly superior productivity tool every developer should have.

FLOAT-87

Software Support for the 8087 Math Chip

Float-87™ is a library of floating-point math routines which are merged into a Lattice C interface library. The routines handle all arithmetic functions and the most frequently used transcendental or trigonometric functions, and pass all numbers to the 8087 to take advantage of its 80-bit data format.

Putting Float-87 to work with an 8087 can increase the speed of floating-point calculations by 40 times or more — and with greatly expanded accuracy. If you or your customers have an Intel 8087 math processor chip on board, this software will switch on its afterburners.

Change the last occurrence of the word *people* to *men*. Change all occurrences of *country* throughout the text to *nation* in the quickest way possible. (Note that the word *country* begins with a capital letter in one instance.) Go back to the top of the file and change the title "Lincoln's Gettysburg Address" to all uppercase; use a special subcommand for that purpose if there is one.

☐ Bank Street Writer

Move highlight to the REPLACE command and press the Return key. Answer yes or no (Y or N) to the screen queries "Replace everywhere without asking?" and "Match upper/lower case exactly?" BSW handles only one job at a time; after a task is completed, the program shuttles you back to the Edit screen, and you must select REPLACE again.

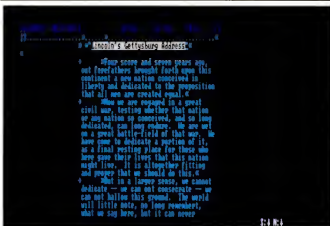

☐ EasyWriter II

Strings of up to 50 characters can be searched for and replaced (one-by-one or globally) by using the Shift-F9 key combination. An Ignore-case (I) option finds both *country* and *Country*. (A Preserve-case [P] option replaces them with *nation* or *Nation* as needed.) The Previous and Next keys direct the search backward and forward, respectively. But the global option searches only the current page. A separate step is required to cross page boundaries and continue the search.

☐ FinalWord

The search and replace routine is executed from the front of a document to the back. To replace all references to the word *country* with the word *nation*, press Ctrl-Home to get to the beginning of the document and the Alt-F2 to invoke the SEARCH AND REPLACE command. The program will prompt you for the search string and remind you to indicate the end of the string by pressing the Esc key rather than the Enter key. Type COUNTRY and press the Esc key. The program will then prompt you for the replacement string. Type NATION and press the Esc key. The

MULTIMATE

The editing screen for *MultiMate*. The arrows at bottom right indicate that the CapsLock and NumLock are off.

search and replace operation will proceed. In this case, the capitalized occurrence of the letter *c* in *Country* will be replaced with a lowercase *n* in *nation*.

To change the title of Lincoln's address to all uppercase letters, press Ctrl-Home to return to the beginning of the document. Then press Alt-F5 to effect the Capitalization mode. Pressing the End key indicates that one full line on the screen is to be capitalized.

☐ Leading Edge

Press the F7 key, enter the character string, and then press Shift-F7 to enter the replacement string. If you press the plus sign (+) key after the first change, the program will then ask you to verify each of your indicated changes. Pressing Shift-F7 will institute a global search and replace routine. Alt-C will tell the program to ignore case when searching for the letter *c*.

☐ Microsoft Word

Press the Esc key to enter the Command mode and the S key to invoke the SEARCH command. Answer the prompt "Search for" by typing COUNTRY and "Replace with" by typing NATION. Since "no-stop" (global change) is the

default, press the Enter key. *Microsoft Word* will automatically recognize the one instance where the letter *c* is capitalized in *country*.

Return to the top of the document by pressing Ctrl-PgUp and overtype "Lincoln's Gettysburg Address" with all capital letters. (*Word* has no case-convert command.)

☐ MultiMate

Choose either the Discretionary Replace or Global Replace options. If you choose the former, the blinking cursor will appear at the string to be changed. After each character string is identified, type yes or no (Y or N) to instruct the program whether or not to make the change. *MultiMate* automatically ignores case, but you can press Alt-G to make the system discriminate between cases.

☐ Palantir

To start the search process, press the F1 key (to set parameter), then the F5 key (to indicate that what you're setting is the Find parameter). *Palantir* prompts you for a search string and for an optional replacement string. If the search string is found, you're asked whether you want the

Move the last paragraph in front of the first paragraph of the file. Reverse the order of the second and third sentences in what is now the last paragraph.

☐ Bank Street Writer

Move from Writing mode to Editing mode by pressing Esc. Choose COPY by pressing the Tab key. Press Return. Follow the prompts (for example, "Place cursor at beginning of text to be copied, then press Return") to define the block, which will appear in inverse video. The next prompt is to "Move cursor to the desired text location, then press Return." You are then asked "Do you want the highlighted text copied in this location (Y/N)?" Follow the same procedure for MOVE and DELETE. For DELETE, there is also a safeguard: "Are you certain you want to make this deletion?"

☐ EasyWriter II

As long as a block of type doesn't exceed the 4,000-character-per-page limit, block moves are easy. Shift-F6 is the Block mode, but other modes work well, too, especially the Sentence and Paragraph modes. Combinations of CUT (Alt-F3), COPY (Alt-F4), PASTE (Alt-F5), and DELETE (Del) commands soon become second-nature. Screw-ups can be undone by the CANCEL (Shift-F2) command and won't undo other changes to the page. TAG (Alt-F7) and MERGE (Alt-F8) allow shipping of blocks between documents. The program doesn't take advantage of the PC's highlighting and inverse video abilities to distinguish blocks.

☐ FinalWord

Block moves are accomplished with a delete/undelete sequence as follows. Hit Ctrl-End to move to the end of the document. Hit F7 to turn on the Delete mode, and hit Ctrl-PgUp to indicate the previous paragraph. The paragraph will disappear. Hit Ctrl-Home to move to the beginning of the document, hit the down arrow key three times (to get past the title of the document in this case), and hit F8 (undelete). The previously deleted paragraph now

PALANTIR

The editing screen for Palantir. The PC's ten function keys are well utilized, and selected functions are highlighted in reverse video.

appears after the cursor.

To reverse the order of the second and third sentences in the last paragraph, hit Ctrl-End to get to the end of the document. Hit F7 to turn on Delete mode, and hit F5 to indicate that the previous sentence is to be deleted. The sentence will disappear. Hit F5 again to move the cursor to the beginning of the previous sentence and hit F8 (undelete). The previously deleted sentence will appear after the cursor.

☐ Leading Edge

Moving a block is a cut-and-paste operation. Mark the beginning of the block with the appropriate function key, move to the end of the block, and hit +. The block will disappear. To paste, position the cursor at the new location and hit F10.

☐ Microsoft Word

I used the mouse to scroll down by placing it on the left window border and hitting the left button several times. Then I positioned the mouse on the last paragraph and hit the right button to SELECT the entire paragraph.

While holding down the Ctrl key, I moved the mouse to the beginning of the text. When I released the Ctrl key, the last paragraph had been moved to the begin-

ning of the text.

I repeated the above procedure to swap the second and third sentences in the last paragraph.

☐ MultiMate

To copy, press F8. The prompt "Copy what?" appears at the top of status line. Identify the block by moving the cursor (Alt-F8 to define a paragraph, Alt-F7 to define a sentence). The defined block will be highlighted. Press F8 again, and prompt asks "Copy where?" Move the cursor to the new location and press F8 again. To move, press F7. To delete, press the Del key, and a prompt will ask "Delete what?" Highlight the text to be deleted and press Del again. DEL PERIOD will delete a sentence to the period.

☐ Palantir

To define the block to be moved, position the cursor at the beginning and press F1 (the Set key) and then hit B (for Block). Position the cursor at the end of the block and press Return. Palantir then asks you whether you want to move or copy the block, to which you reply M or C. Then move the cursor to the new location and press F1 and M. This procedure works

Introducing the new Project Scheduler 5000™

Help! The demands of managing a project have you frantically juggling people and resources. It's getting more complicated and you're about to drop the ball on profits and deadlines.

Successfully managing one project can be difficult. Successfully managing two or three projects can be overwhelming. But now, help is here for you. With Project Scheduler 5000 you can precisely forecast, schedule, control and track large projects easily and quickly. You can replace your frustration with a sense of self-satisfaction from a project well managed.

Main Frame Power — Personal Computer Simplicity

Project Scheduler 5000 brings mainframe capabilities to your personal computer.

This new generation in scheduling software makes possible what was, until now, only a dream: true interactive use and immediate response to changes and additions. You can schedule over 5000 activities spread over 10,000 time periods. What this means is that you can manage the largest projects with ease. While you probably don't need this power on a daily basis, it's nice to know that you have room to grow.

Interactive "What If" Capability

"What if" scenarios are an important source of information that allow you to make the best decision after trying the alternatives. Now you have time for this kind of in-depth planning, because updating and modifying are so simple with Project Scheduler 5000.

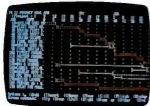

A scheduling package should do more than schedule. With Project Scheduler 5000 you never take the risk of making guesses instead of accurate decisions.

... the best solution to effective project management

On Time On Target

Project Scheduler 5000 gives you all the information you need when you need it. Instantly, you know the status of your project.

At a glance, unique plot symbols will let you know whether or not the project is on time and on target and if not, why. Meeting performance goals will become a habit.

Project Scheduler 5000 keeps you constantly informed through its partial complete capabilities. Partial complete status is displayed, reported and used to calculate "value earned".

Accurate Resource Assignment

Extensive resource categories allow you to schedule more efficiently. Using these categories, you can assign to an activity an almost limitless amount of resources. In addition, these resources can be assigned at any point within the activity timeline providing the accuracy you need to build realistic resource profiles by person, labor grade, or other types.

Integration Of Multiple Projects

Keeping track of how a resource is used from project to project can be extremely difficult. Not with Project Scheduler 5000. The program can combine projects to give you a complete overview of where and when resources are used. Graphic presentations can be condensed allowing you to visually compare multiple projects quickly and easily. Think of it! You can simultaneously manage several projects and be on time and meet or beat cost projections on each one.

Get The Picture Any Way You Want It

Hours, days, weeks, and months. You can select the resolution you need. In addition, you can break days into as many as 99 units to provide detailed shift or hour resolution. Get the big picture of your schedule on the screen or report by selecting a compressed format which displays up to 60 days, weeks or months of a project.

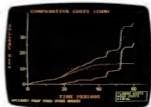

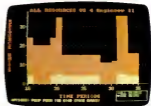

Fast Comprehensive Reporting

Communicating project information is no longer the time consuming task it used to be. An enhanced report generator synthesizes project information into reports on resource allocation, status, schedule and cost at both the project and the detailed activity level. You can interactively define special reports to give you all the detail you need. Reports and Gantt plots can be printed on hard copy or stored on disk for future use. Presentation quality graphics are available on a color plotter. Additionally, a spreadsheet interface provides labor and cost transfers for further analysis.

Integrated Graphics Power

Project Scheduler 5000 plus Graphics complements the outstanding scheduling and reporting features provided by Project Scheduler 5000. Using presentation quality financial line graphs, resource histograms, resource bar graphs and other high impact displays, Project Scheduler 5000 plus Graphics provides additional insight as you study in depth the effects of resource allocation, labor usage distribution and cost spreads.

With this control tool you can also track your original cost estimates against updated forecasts and expenditures. Project Scheduler 5000 plus Graphics will help eliminate the possibility that you'll overlook critical costs and deadlines.

Available for PC or MS DOS:
IBM PC or XT
TI Professional
Wang PC*
Grid Compass*
DEC Rainbow*

*Project Scheduler 5000 plus Graphics available 4th quarter 1984.

ISCITOR

ISCITOR CORPORATION
256 Gibraltar Drive
Sunnyvale, CA 94089
(408) 730-0400

Format the three paragraphs of the Gettysburg Address using full left justification and ragged right edge, a left margin of 20, a right margin of 60, and a first line indentation of 26. Then reformat the paragraphs so that they are flush right and left.

☐ Bank Street Writer

In Edit mode, press Tab until FORMAT is highlighted, and then press Return. In FORMAT, choose the feature you want to change. Copy does not realign after formatting, so you have to help it along by using the Del key to eliminate extra spaces.

☐ EasyWriter II

EasyWriter II allows up to eight rulers per document, each controlling left and right margins, right-margin justification, tab stops and decimal tabs, character spacing, and lines per inch. Rulers can be named and called from other documents. Shift-F1 calls the ruler menu. A ruler remains in effect until another ruler is encountered. An R at the right margin indicates where rulers change. Once a ruler is set, paragraphs are reformed by pressing F8 (Adjust) or through the main menu's Pagination option, which affects the whole document at once. Other page formatting options, including lines per page, page offset, and the hot zone/balance point option, are stored in the System Parameters menu. Unfortunately, after the Adjust key is pressed, the cursor stays in place instead of moving to the next paragraph. Also, paragraph indents are wiped out during Adjust or Pagination unless the space is held by tildes inserted as "nontrivial blank characters." The tildes won't print from EasyWriter II, but they will be passed along if the file is exported in ASCII form.

☐ FinalWord

You cannot set a left margin in FinalWord. All text always begins in the first column. The normal left margin for printing is set as a default printing parameter and can be overridden at print time to make a different left margin. To change

PC-WRITE

F1 Help. Overwrite Off. %ix Free. %ix Thru. Read "gettysb.rgh"
"Lincoln's Gettysburg Address"

Four score and seven years ago our forefathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived, and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of it, as a final resting place for those who here gave their lives that this nation might live. It is altogether fitting and proper that we should do this.

But in a larger sense we can not dedicate -- we can not consecrate -- we can not hallow this ground. The world will little note, nor long remember, what we say here. The brave men, living and dead, who struggled here have consecrated it, and above our poor power to add or

The editing screen for PC-Write. The Overwrite function on the command line can be toggled into Insert with the Scroll/Lock/Break key.

the right margin (actually, line length), hit Esc while still in the file. The program will prompt you for a numeric argument. Enter the numerals 40 and hit Shift-F10. That will change the line length to 40 characters. In order to set the tab spacing to six characters, hit Esc again, the number 6, and Alt-F10. There is no command in FinalWord to reformat an entire document, so you have to go through and reformat each paragraph. This is done by hitting Ctrl-PgDn and F9 for each paragraph. The first command moves the cursor to the end of the next paragraph and F9 reformats the paragraph according to the new margins. This takes about 7 seconds. You have to move each line flush right individually, by putting the cursor on a character in the line and hitting Ctrl-R. It takes about 1½ seconds per line.

☐ Leading Edge

To set the margins, hit F3, place the cursor at desired left and right margins, and press L and R. To produce a flush-right edge, hit F3, move the cursor to the right margin, and hit J and the plus sign (+).

☐ Microsoft Word

To format text, select the FORMAT DIVISION command and answer the

prompts to create left and right margins and to turn right justification on and off.

☐ MultiMate

You use F9 for formatting. The cursor jumps to the ruler at the top of the screen. You change tabs by using the space bar to erase, and by pressing the Tab key to put one in. As the cursor moves to the right, there is a handy column count.

You choose the right margin by reading the column count. When you reach 60, you press Return and then F9 again, and the formatting is done. There is continuous realignment of copy. You can't produce a flush-right edge on-screen—you have to do it just before you print.

☐ Palantir

To set margins, press F1 (Set), F7 (Format), and L for left or R for right. Then move the cursor to where you want that margin to be, and press Enter. To indent the first line, press F1 (Set) and Tab when you're entering it. Paragraphs are formatted on entry. To reformat them, move the cursor to the first line and press F7 (Format). To indicate that paragraph formatting should be flush right, press F1 (Set), F7 (Format), FJ, and then Enter.

(continues on page 136)

**Better
productivity
grows
on the
Peachtree.[®]**

And it's no surprise.

Only one software company so completely covers business, home and education.

Only one is backed by the resources of the world's largest independent producer of mainframe software, Management Science America, Inc. (MSA).

And only one offers you the most complete line for microcomputers. Peachtree Software®. The pioneer that's still pioneering. With 25 new products this season, 67 in all. And with applications for IBM, Apple and most leading microcomputers.

Case in point: our new Decision Manager. Created to give executives higher productivity on the job than ever before. With up to ten windows displayed at once, dramatic graphic capability, mainframe communications link and much, much more. The perfect companion to our PeachText 5000.

Case in point: our famous PeachText 5000™. A complete package for better office productivity, including word processing, financial spreadsheet, Random House thesaurus, spelling proofreader and list manager. Even includes free special instructional software for a limited time.

Case in point: our new Back To Basics Accounting System. Created for the small businessman with a new PCjr™, Apple, Atari, Commodore or almost any leading microcomputer. Lets him set up his basic accounting system even if he has little or no previous accounting knowledge.

Whether it's for business, home or education, America's software grows on the Peachtree. Look for all our products wherever software is sold, or send us the coupon for a free brochure.

Better productivity grows on the Peachtree. Reach for it.

CQ09044B

Print the file, triple-spaced, with the word Page and the current page number in the upper right-hand corner of each page but the first.

☐ Bank Street Writer

Choose Print from the Function menu, press Return, and follow the series of prompts.

☐ EasyWriter II

EasyWriter II's options include print queuing, multiple copies, printing specified page ranges, simultaneous printing and editing, quick memos typed and dumped to the printer without opening a file folder, printing only the current page without exiting to the main menu, and printing draft copies with lines numbered and ruler locations marked. Headers and footers can be on multiple lines and can be changed throughout the document. There's an optional *EasyMailer II* program for merge-printing.

☐ FinalWord

At the very beginning of the text, you insert

@STYLE (spacing 3 lines)

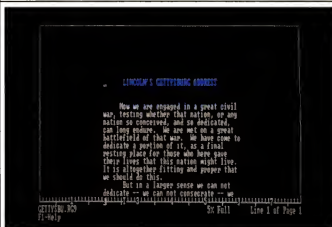

to make the document appear in triple space. The default pagination procedure for *FinalWord*'s advanced formatting is to put the number at the center of the bottom of the page. In order to suppress this, you would embed the code @PAGEFOOT-ING() after the style command. In order to get the literal and the page number in the upper right-hand corner, you would have to specify a header, which would take the form

```
[@PAGEHEADING(right
"PAGE@VALUE(page)"]]
```

This code should be embedded in the text somewhere after the first few lines of text so that the first page would not have a header.

After you have made these changes in the text, you hit Ctrl-A (for advanced print). The program will then prompt you for print options such as the number of copies to print, the device to use, at which

PFS:WRITE

The editing screen for PFS: WRITE. The paragraph indents are indicated by the letter T on the on-screen ruler below.

page to start printing, and so on. There is no menu for the options, so you must remember them or check the manual. If you are not planning to override any standard printing parameters, just hit Enter. The program will write the buffer to disk and then produce an intermediate file, with the extension .FSS, which contains the printer control codes necessary to produce the document. Once the .FSS file is produced, the program will pause and ask if you would like to print. Hit Y for yes and the document will print.

☐ Leading Edge

To print, close the file, go back to the main menu, choose Print, and hit the plus sign key. Hitting 5 on the number pad brings up a utility menu that allows adjustment of page headings and footings, including page number.

☐ Microsoft Word

Some formatting commands are done by "division" (page elements chosen by the user) and some by paragraph. In order to suppress the number on the first page, I simply refer the first page to its own division, do not number that one, and start the page count at two on the second division (the next page).

Triple spacing is simply a matter of electing a spacing count in the paragraph-formatting subcommand (formatting is by division, paragraph, or character).

Since the primary commands are always shown on the edit pages, simply choose the PRINT command to print.

☐ MultiMate

To print, go to the Print Document utility in the main menu, which presents you with a large series of options, depending on what you want to do with the file.

☐ Palantir

Pressing F1 (Set) and H (heading) allows you to indicate what should be in the heading. You can indicate that the current page number appear in a heading (or footing) by moving the cursor to where the page number should appear and pressing F1 (set) and #. To request triple spacing, press F1 (set), F7 (format), O (other), S (spacing), 3, and then Enter.

☐ PC-Write

The editing file and printing files are not integrated. To print, you have to return to DOS and call up the Print field and send the document to it to handle the job.

(continues on page 170)

Program	Can edit during printing?	Can edit after printing?	Can format page number?	Can suppress page number?	Can format top and bottom margins?	How many printer support files?	Has device support language?	Claims universal printer support?
BANK STREET WRITER	NO	YES	YES	YES	YES	Nonspecific support file	YES	YES
EASYWRITER II	YES	YES	YES	YES	YES	75	YES	NO
FINALWORD	NO	YES	YES	YES	YES	28	YES	NO

XYWRITE II-PLUS	YES	YES	YES	YES	YES	18	YES	YES

Enter an illogical or misspelled subcommand. Open the door of the data disk drive and try to save the file.

□ Bank Street Writer

Errors are handled well. An illogical subcommand elicits a beep and a very explicit message. An I/O error elicits a beep and the following message: "Disk error, check disk and drive—press Return to continue."

□ EasyWriter II

Errors are generally trapped without damage to the document, and short messages explain what went wrong. Running out of disk space means you'll lose your last changes, but never more than one page. And since *EasyWriter II* lists remaining disk space on-screen during editing, you're forewarned. Swapping *EasyWriter II* system and housekeeping disks is OK, but it's possible in some instances to do serious damage to a file folder by swapping data disks. My experimentation with disk swapping to see what could go wrong rendered an entire file folder unusable. Using *EasyWriter II*'s check-for-errors utility then hung up the system.

□ FinalWord

If you try to save a buffer to disk with the drive door open, you will get the standard DOS error message: "Not ready. Error reading drive B: Abort, Retry, Ignore?" Close the drive door and hit R. The buffer will write out to disk. However, the DOS error message remains on the screen until you hit the Ctrl-D key combination (display refresh), which restores the original text screen.

□ Leading Edge

An illogical command will elicit a short error message. An I/O error elicits a message saying that there is a problem and asking you to fix it or try again.

□ Microsoft Word

The program tries to recover from I/O errors for 30 seconds, then beeps and asks you if it should try to save out to NEW-FILE.TMP.

READ!WRITER

to Page 4
p Now we are engaged in a
great civil war, testing
whether that nation, so any
nation so conceived, and so
dedicated, can long endure. We
are met on a great battle-field
of that war. We have come to
dedicate a portion of it, as a
final resting place for those
who here gave their lives that
that nation might live. It is
altogether fitting and proper
that we should do this.
p But in a larger sense we can not dedicate -- we can not
consecrate -- we can not hallow this ground.
gettsbu 20 1 1 Replace Push 11 key for help
```

The editing screen for *Read!Writer*. All of the formatting commands are indicated by the codes to the left of the main text.

□ MultiMate

Error messages in response to illogical commands are simple and self-explanatory. In response to I/O errors, *MultiMate* generates a beep and issues the following error message: "Drive B: is not ready. Close drive door. Press A to abort; I to continue; R to retry."

□ Palantir

If you make an invalid menu selection, *Palantir* will beep you. In more complicated contexts, it will produce more helpful error messages. *Palantir* will not, however, recover from I/O errors of the sort that cause DOS to prompt "Abort, Retry, Ignore?" If you press A in response to one of these messages, you go back to DOS immediately and whatever you were working on is lost. It can be dangerous to swap disks while editing, because *Palantir* uses spill files when in the middle of block operations.

□ PC-Write

Errors are not signaled by a beep. I typed in a wrong subcommand: an erroneous name for a file. The *PC-Write* error message was clear: "Wrong name for the file?" *PC-Write* error messages are usually self-explanatory. The manual includes a

glossary of them in Appendix C. Many are familiar DOS messages, and explanations are good.

PC-Write handles I/O errors the same way as DOS—Abort, Retry, Ignore? The program warns you if you are about to run out of disk space.

□ Perfect Writer

Because of its menu-driven structure, which will not accept an illegal entry, *Perfect Writer* permits fewer opportunities for common user errors than many similar programs. Program error messages are generally in plain English and appear as highlighted windows.

□ PFS:WRITE

PFS:WRITE is pretty much bulletproof: errors don't do any damage to the program. The on-screen error messages are self-explanatory; they tell you, for example, that you tried to retrieve a nonexistent file, or that you set a margin bigger or smaller than allowed. Since your document is in RAM, trying to write a finished document to a full disk is no problem; simply stick in another disk and try again. An I/O error just returns you to the main menu.

(continues on page 173)

HARD DISK + With A Single Slot.

Unleash your IBM-PC/XT with IDT's hard disks and SCSI technology.

Innovative Data Technology is bringing unprecedented power and virtually unlimited expansion to IBM-PC/XT users. Our new SCSI (Small Computer Systems Interface) hard disk subsystems put massive storage capacity at your fingertips—from 11 to 126 MB in a single external drive. With the capacity of configuring up to 14 drives through the SCSI bus, that puts nearly two billion bytes of on-line storage at your disposal.

Single slot expansion

Unlike most PC add-ons, IDT's SCSI hard disk subsystems and other peripherals are connected through a single SCSI host adapter on your PC—no additional expansion slots or cards are necessary—future disks and other peripherals and additional PC hosts are simply daisy-chained into the SCSI bus.

Multi-user capability

IDT built the SCSI hard disk subsystem with multiple users in mind. One, two, or more IBM-PCs can access disk drives and other peripherals through the SCSI bus, allowing you to build a sophisticated system tailored exactly to your requirements.

The options are yours

With IDT's SCSI host adapter board, future expansion becomes a snap. Additional peripherals, including an extensive line of 1/2-inch IBM-compatible magnetic tape transports, are available for immediate shipment from IDT. You simply don't have to wait or worry about equipment compatibility with IDT components. Watch for 1984 announcements of streaming cartridge drives, printers, etc.

Tomorrow's solution today

IDT's SCSI host adapter and SCSI hard disk subsystems will answer your data storage and system design requirements today. Contact IDT for complete system configuration information and details on other products.

How to order:

Using the chart to your right, you may order IDT hard disk subsystems and SCSI host adapters by calling:

1-800-522-1500 Ext. 717
FOR IMMEDIATE ORDERS ONLY

Prices and availability subject to change without notice. No C.O.D.s. Send cash or check or money order. All other checks will delay shipping three weeks. MasterCard and Visa accepted (include telephone number). Add \$12.00 for handling and shipping UPS ground within the continental U.S. California residents add 6%. Approval needed on all returns. 0-10% restocking charge on all returned merchandise.

Successful and easy installation assured

Supplied with each component are the required cables, complete software driver package and user language instructions. The user manual will have you quickly running and appreciating the many features of the subsystems, such as quick automatic boot load of the operating system from the IDT disk subsystem.

Satisfaction guaranteed

If not satisfied, the subsystems may be returned on approval from IDT within a 10-day period. All subsystems and components carry a six-month return-to-factory warranty on parts and labor.

COMPONENT PRICING CHART

Model No.	Description	Storage Capacity	Price
RD 201M	Master Disk Subsystem	11MB	\$2000.00
RD 2023M	Master Disk Subsystem	23MB	2550.00
RD 2035M	Master Disk Subsystem	35MB	2950.00
RD 2047M	Master Disk Subsystem	47MB	3150.00
RD 2126M	Master Disk Subsystem	126MB	6840.00
RD 200S	Slave Disk Drive	11MB	1560.00
RD 2023S	Slave Disk Drive	23MB	2130.00
RD 2035S	Slave Disk Drive	35MB	2530.00
RD 2047S	Slave Disk Drive	47MB	2730.00
RD 2126S	Slave Disk Drive	126MB	6290.00
RD 811H/A	IBM-PC/XT Host Adapter		\$10.00
IDT 1/2" Magnetic Tape Subsystems			Consult Factory
IDT 1/4" Streaming Back-up Tape Subsystems			Consult Factory

Ordering Example:

If your need is a 23MB Subsystem, your order would consist of the following components:
1-RD 2023M @ \$2550.00 + 1-RD 811H/A @ \$10.00 + Shipping & Handling @ \$12.00 =
A Total Order of \$3072.00 + tax (if applicable)

IBM is a trademark of International Business Machines Corp.

Quit the file, exit the program, and return to DOS.

Bank Street Writer

To exit the program, you can choose the Quit to PC-DOS option from the main editing menu. There is also a utility menu that will perform several functions, such as Quit to Format Disk. It is very difficult to exit *Bank Street Writer* without being stopped and reminded to save the file you've been working on.

EasyWriter II

Quitting *EasyWriter II* and returning to DOS is quick, and there's almost no chance of losing text, since the Esc key that returns control to the main menu automatically writes changes from RAM to disk.

FinalWord

To exit back to DOS, hit Ctrl-E (for Exit). If the buffer has been written out to disk, you will go directly back to DOS. If the buffer has been edited since it was read in from disk or was created in *FinalWord* and never written to disk, the program will ask for confirmation that you wish to leave the program. Hit Y for yes. This confirmation is not really necessary because any buffer you have created or edited is still part of the SWAP file that resides on the program disk. The confirmation simply checks to see whether you have written that buffer out to a separate file on disk.

Loading Edge

To exit the file, you simply hit the Esc key twice.

Microsoft Word

Hit TRANSFER from the Edit screen command line. You are given a collection of things to do: one is to save. If you save, you are asked for a filename or to verify a filename. You're also asked if the file should be saved in a formatted configuration.

To get into DOS, hit QUIT from the Edit screen. If you quit without saving the file, the program will prompt you either to save the file, abandon it, or cancel the command.

SAMNA WORD III

The editing screen for *Samna Word III*. The columns of reverse video, which indicate the margins, can be turned off if desired.

MultiMate

To exit the file, press Alt-9. The working file is automatically saved, and DOS comes up.

Palentir

After saving the file, you go back to the main menu. At that point, pressing the Esc key will return you to DOS.

PC-Write

Exiting the program is simple. You simply press F1, and the status line at the top tells you that your file is being written to disk. Press F2 and you are back at the DOS prompt.

Perfect Writer

To exit the program at any point, simply strike the Esc key to get back to the main menu and then E for Exit. The program's initial boot-up screen appears with a number of program options. The user chooses R for Return to DOS and is prompted to reconfirm the exit.

PFS: WRITE

To exit to DOS, return to the main menu and choose the Exit option. If you have a document stored in RAM, you're reminded to save it first.

ReadiWriter

Exiting ReadiEdit is a simple matter of issuing a QUIT command before editing a file or after quitting a file. *ReadiWriter* is more like a compiler than an interactive program. When it gets to the end of the file you've asked it to format, it cleans up and stops.

Samna Word III

You save the file by hitting the F1 function key and then the Enter key. You exit to DOS by hitting F9, X (for Exit), and the Enter key.

SELECT Bilingual

Exiting the program is accomplished by quitting the file you were working on (which brings you back to the main menu) and typing Q (for Quit), and then S (for System).

Spellbinder

Spellbinder does warn you if you try to exit before files are saved. In fact, it won't allow you to exit to DOS without a controlled withdrawal from the program. However, shutting off the power without closing the files may damage the active file.

(continues on page 174)

Program	Warns of unsaved file?	Must run another program to translate to printer control characters?	Time to process file
BANK STREET WRITER	YES	NO	15 seconds
EASYWRITER II	File automatically saved	NO	10 seconds
FINALWORD	YES	Yes, if using advanced formatting	24 seconds
LEADING EDGE	Can't exit without saving	NO	Immediate

WORDMARC	Menu structure forces save	NO	2 seconds
WORDPERFECT	YES	NO	Under 4 seconds
WORDSTAR	YES	NO	Varies
XYWRITE II-PLUS	YES	NO	Immediate

What was your overall impression of the word processor you reviewed?

□ Bank Street Writer

Bank Street Writer's greatest virtue is its simplicity. But is *Bank Street* too simple? Can a program that can be easily learned by 8-year-old children be a serious choice when compared with 192K word processing programs?

The answer is yes. You can take the *Bank Street Writer* seriously, folks. It is a wise choice as the family word processing program. And while some members of the family may want to move on to another word processing program with more versatility and features, *Bank Street* can serve just about any word processing need a family has.

It does have some drawbacks. I am an experienced writer who does not like limits on the amount of work I can handle. *Bank Street* treats me a little like a child, assuming that I can make small changes quickly (in the Writing mode) but that I should be slowed down when I mess with whole sentences or even whole paragraphs. There is something patronizing about this arrangement that irritates me.

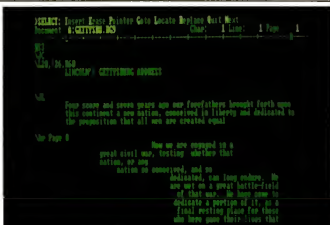

In the same vein, sometimes *Bank Street* puts me through too many steps to remove text. Usually, when I am ready to delete text, I have a roaring need to get it out of the way. But it takes eight keystrokes in the *Bank Street* Erase function to eliminate what I am pretty certain I no longer want. Thus, to experienced word processors, *Bank Street* can seem a bit too cautious.

You will have to decide for yourself. But be assured that this little gem is a very professional and surprisingly versatile word processing program.

□ EasyWriter II

EasyWriter II falls in the great middle between super-easy-to-learn, limited-function word processing programs and powerful, painful-to-learn programs. If you can adapt to two or three of its major quirks—orientation by pages instead of complete documents, no automatic hyphenation, and many documents stored

SELECT Bilingual

The editing screen for *SELECT Bilingual*. There is no on-screen formatting; the user must insert the appropriate formatting codes.

together in a single file folder—you'll probably be very happy with *EasyWriter II*. It loads automatically, text is saved automatically, no more than a single page is ever at risk in the event of a power failure, what you see on-screen is just about exactly what you get on the printed page, the search/replace and printing facilities are excellent, and the program is fairly easy to learn.

The page orientation takes some getting used to, and the mode method of editing will slow down a quick typist who makes more than a few errors. But overall, its pluses seem to outweigh its minuses.

□ FinalWord

FinalWord is not easy to learn, but you will find it very rewarding in the long run. I think its greatest strength is its many different commands and the option it gives you of attaching those commands to the keyboard sequences of your choice. This ability makes *FinalWord* one of the most versatile and powerful programs on the market. Its versatility might be lost in a multi-user environment, where people might disagree on how to customize the program, but for a single user it is a god-send.

FinalWord lacks some of the snazzy

features that other word processors offer. It does not come with a spelling checker (though the pure ASCII files it generates are easy to proof with commercial checkers). It is no good at hyphenation, has a poor indexing feature, and has no mail merge feature. Although a great deal can be done in its simple print mode, advanced formatting and printing—for those who must have footnotes, tables of contents, and so on—is a little tricky to learn. Nevertheless, in the basic business of creating and editing text, *Final Word* is truly a joy to use.

□ Leading Edge

I tend to react negatively to hype, so the three-page *Leading Edge* ads that start with the statement, "It can change the way you work, the way you think, the way you live," ensured that I approached the program with a great deal of skepticism. I came away ready to give *Leading Edge* a qualified recommendation, which means that the program is doing something right. This is not to say that *Leading Edge* lives up to its ad; few things short of religious conversion could. Still, it does have many attractive features such as its ability to edit two files at once, its sophisticated Search

(continues on page 177)

Program	Can personalize file?	Can "print to disk"?	Can generate table of contents?	Can generate an index?	Can generate footnotes?	Built-in spelling dictionary?	Other notable features

(continued from page 114)

PC-Write

Any working or data diskette you use has to be copied with *PC-Write*'s editing file and printing file. You then load up the RAM with DOS and, at the A> prompt, do one of three things: you can type DOS DIR to see a directory of files and make your choice of which file you want to edit; type ED <filename> if you are creating a new file; or simply type ED if you want to create a new file that you have not yet named.

It is noteworthy that this program uses only one disk drive, which contains the program and the data you are creating. One way of looking at this is that each disk is self-contained, but another way is that it is a pain to have to copy the *PC-Write* files to each and every disk you plan to use.

Perfect Writer

The first screen that appears has a nine-part menu with choices for word processing functions, exit to DOS, file utilities, and access to *Perfect Calc*, *Perfect Graph*, *Perfect Link*, and *Perfect Filer*.

To load a file, choose the Write/Edit option from the main menu. The program prompts you for the filename, and pressing the Enter key calls up the document. If you're unsure of the name, choose the Documents option and the Directory function from the Documents submenu. *Perfect Writer* prompts for the drive and produces a directory in a highlighted mini-window. Put the cursor at the desired filename and strike Enter to load the file.

PFS:WRITE

PFS:WRITE is almost completely menu-driven. To fire up the program, pop the copy-protected diskette in drive A: and type WRITE. The main menu offers six options that allow you to type/edit, define page, print, get/save/remove, clear, and exit. To begin writing a new document, select the Type/Edit option and then press F10 (the Continue key). All PFS programs use F10 instead of the Enter key to mean "continue."

PFS:WRITE accepts ASCII files when you type F9 (the Append key), give the filename, and press F10. There are no restrictions on filenames, such as .BAK, .EXE, .COM, or .\$\$\$ extensions. The name can be preceded by a drive name, but *PFS:WRITE* won't work through DOS 2.0/2.1 subdirectories. If the file being imported has blank spaces to the left of the text, as did PC's test file where text was aligned at the right margin, *PFS:WRITE* will format the text oddly, and the effort to edit out the blanks may be more trouble than it's worth. It's also possible to insert a file at print time by typing JOIN <filename> at the appropriate place. Graphs from the *PFS:GRAPHS* program can also be inserted by this method.

ReadiWriter

First, load the ReadEdit program, which contains the text editor for the *ReadiWriter* package. This puts you into a blank screen with the command line at the bottom. Use the EDIT subcommand to load the file. There are no restrictions on the filenames or name extensions.

Samna Word III

This program must be loaded from two disks. The first disk boots for 30 seconds, after which a beep tells you it's time to put in the second disk, which takes another 24 seconds to load. The program will then prompt you for the date and time. It will pick up the system date and time but waits for you to accept them (by hitting Enter) or to change them before it will go on to the opening screen.

Hit F9, T (for Translate), A (for ASCII-to-Samna), type GETTYSBU.RG (to indicate the source of the translation file), Y or N (to indicate whether you want Samna "new paragraph" marks at the end of each line or at the end of each paragraph), and hit Enter. The entire file will then scroll up the screen as it is translated into Samna format.

SELECT Bilingual

The initial screen has a menu of subcommands for edit, help, save, print, and other such operations. Loading is a simple matter of using the EDIT subcommand. Since

incarnations of your file get saved with various extensions such as .BAK, .SEL, .TTY, and .SPL, you're effectively restricted to identifying your file by filename only.

Spellbinder

There is no main menu.

Loading or opening a file can be a multistep process. You need to open a read file (where the document is now) and a write file (where the document is headed). All told, there are 14 separate read and write commands. For short memos, however, it's possible to work in RAM without ever creating a file and then dump the memo to the printer. DOS 2.0/2.1 subdirectories aren't supported. ASCII files can be used once they're stripped of carriage returns and unwanted spaces to the left of the text.

Volkswriter Deluxe

To load a file, type R. The program then prompts for a filename. Type the filename and then hit Enter. In the initial start-up screen, the top three lines are a menu of the program's main options to retrieve a file, edit, print, and so on. Also included are file maintenance commands. There is a 17-line blank window that will display a directory when requested. To load a file, type R <filename> at the main menu.

WordMARC

WordMARC's initial screen is a menu that offers various edit, file, and print modes. To load GETTYSBU.RG, select the Edit option from the first menu screen and answer the prompt for a filename.

WordPerfect

After booting up DOS on the PC, type WP. A preliminary screen indicates that the program is loading, and after about 3 seconds the main *WordPerfect* screen is displayed. There is no main menu; the start-up screen is blank and ready to accept text.

WordPerfect can both import and export ASCII files. Press Alt-F1 to get the Extended Features menu and then choose the second option (Prepare/Protect documents) to call up another menu. Select the

option to retrieve a DOS text file, and you are prompted for the name of the document. Then press Return, and the file will appear on the screen.

☐ **WordStar**

The initial screen is divided into two sections: an opening menu and a directory of the logged disk. The menu is divided into five clearly labeled sections, including preliminary commands, file commands, system commands, commands to open a file, and options. To open a file, hit D at the main menu, and at the prompt give the name of the desired file.

☐ **XyWrite II-plus**

Loading a file can be accomplished in several ways. The basic commands for text files are CALL or EDIT (which, like the majority of XyWrite commands, can be abbreviated to the first two letters) and they are executed from the command line, followed by the name of the file you want. There are no restrictions on filenames that are not found in DOS. If you are not sure of the name, you can call up a directory with the DIR command, type CA or ED on the command line, move the cursor to the file you want, and hit F9. If your file is a XyWrite program file or form file, the command is the same, except that you add a P in the case of program files or an F in the case of a form file (in which case you also have to give the name of the file you want to create from the form).

HELP SCREENS

(continued from page 116)

☐ **SamnaWord III**

The Esc key is the Help key. It can be used to bring up a menu of initial help information, or, in combination with specific commands, to bring up help information about those commands.

A directory of the files on the B: drive can be obtained by hitting F1, D (for Directory), and Enter.

☐ **SELECT Bilingual**

You can get help on any topic at any time by typing H and the first letter of the specific subcommand. SELECT Information

Systems deserves special credit for offering a bilingual word processor. At any time during its operation, the BILINGUAL command will switch between English and Spanish for you. All prompts, menus, and messages are presented in the language of your choice.

☐ **Spellbinder**

To get on-screen help, hit F1 to switch from Edit to Command mode, then press F2, then choose one of several help file suboptions. Sound awkward? It is. The help messages are contained in a series of text files, so you can tailor or add to them if you need to. There is no keyboard template, although it would be a big help to have one.

☐ **Volkswriter Deluxe**

Included in the start-up screen is a menu of the program's main options: Retrieve a file, Edit, Print, and so on. Also included are file maintenance commands. At the opening menu, type H for an explanation of main options. During editing, F1 will call up a menu of editing commands on the top seven lines of the screen. There is a 17-line blank window that will display a directory when requested.

☐ **WordMARC**

There is no on-line Help facility with information about specific keys or subcommands; however, the prompting is good. Once you are accustomed to the program, you can get rid of all the menus and run the program with commands only.

☐ **WordPerfect**

WordPerfect provides a good help system. By pressing Shift-F3 and then the combination of keys for the command in question, a Help screen appears for the selected command. A keyboard overlay shows just about every command combination, and 10 self-stick key overlays are color-coded to match the keyboard overlay.

☐ **WordStar**

As shipped, menus with general help information are always on-screen. They can be toggled off when they are no longer

needed. Ctrl-J takes you to a separate help menu where you can ask for more information about functions. From within a file, Ctrl-JH will let you choose from any of four help levels, or you can reinstall the program so it will boot up in the help level you prefer.

A directory of the logged disk appears on the opening screen and can be toggled on and off.

☐ **XyWrite II-plus**

Four screens of help can be called up by hitting Alt-F9 four successive times. They contain information about the key functions and editing commands for most of the commands you are likely to use for everyday word processing. Since they are ASCII text files, you can edit them or write your own help from scratch. After you have made up help files, you must name them HELP0, HELP1, HELP2, and HELP3 so that the program will recognize them.

ENTERING DATA

(continued from page 118)

☐ **PC-Write**

At the top of the screen, you see a single status line that reads:

```
F1 Help. Over. Just Off.
99% free
99% thru Edit "Work.doc"
```

Under this line, the cursor sits at top left. You enter text by choosing which mode you want: Insert or Overwrite. You switch into one or the other by toggling the Scroll Lock/Break key.

If you call up a file just to look at it, the status line will say Read instead of Edit. Make a change, however, and you will know instantly that you are in the Edit mode. If you justify the right margin, the status line will tell you that, too. You can also insert a helpful ruler line by simply pressing F2 and letting it stay on the screen. The program supports a full 156 characters a line.

☐ **Perfect Writer**

The Edit screen is blank except for two

lines at the bottom. The first, in inverse video, lists the program name, filename, and three status indicators: wordwrap on or off, text revised but not saved, and delete buffer empty or full. The bottom line carries a copyright notice and informs you that the Esc key brings up the Help menu.

□ **PPS: WRITE**

The start-up screen displays a rectangle representing a sheet of paper, with a ruler line at the bottom, margins set at 10 and 70, and a single tab stop at 15. Start typing and the first bit of text appears ten spaces over and six lines down, just like on a sheet of paper. As you type, a second cursor marks your position on the ruler line. Long words automatically wrap to the next line. After you have typed 54 lines, a second electronic page scrolls into place just below the first. If you previously ordered up a page number or a footer (through the Define Page option at the main menu), that appears here, too, centered at the bottom of the first page.

□ **ReadiWriter**

The screen has a reverse-video command line on line 24. Line 25 is a status line that contains the cursor row and column number, insert/replace toggle, the message "Push F1 key for help," and the current file specification.

□ **Samsa Word III**

The initial Edit screen has columns of reverse video down the sides, which indicate where the margins are set. (This light show can be turned off if you don't like it.) The top line is reserved for commands and always displays the message "READY!" when the program is prepared to accept commands. The second line indicates the page, column, and line number of the cursor's current location and gives the name of the file being edited. The third line of the screen is a ruler that indicates right and left margins and tab stops.

□ **SELECT Bilingual**

The editing screen is blank except for a menu line, a status line, and a ruler line. The menu line offers functions such as

Insert, Locate, and Replace. The status line indicates the name of the open file and the current character, line, and page numbers.

□ **Spellbinder**

During text entry, the top of the screen indicates whether *Spellbinder* is in the Edit or Command mode, whether insert is on or off, the cursor position, and the current text mode: character, word, sentence, paragraph, or mark (a block stretching down to a caret [^] mark). Text can be deleted, moved, copied, or enhanced (underlined, boldfaced) in any text mode. Function keys convey most of the edit commands. The screen holds 80 characters across, and long lines automatically wrap down. File size is limited only by RAM capacity and longer documents can be held partly in RAM and partly on disk.

□ **Volkswriter Deluxe**

In the editing mode, the bottom line is in reverse video. It gives information about the default drive, the filename, line, column, and page number. To convey editing commands, you use the function keys—alone or in conjunction with the Alt, Ctrl, or Shift keys.

□ **WordMARC**

Type WM and hit Enter to get into the program. Select Edit from the initial menu by pressing the Execute key. You get the message: "Type the document name and press Execute or press the file key." Pressing the file key brings up a menu of existing documents. If you want to use a new document name, type that name in the directory and open up a file.

To create a new document, select the "Create a new document option." This presents you with a new menu that offers a selection of preprogrammed formats. The formats offered by the system are Letter, Memo, Manual (from scratch), TWX (teletype—all caps), Wide, ASCII, and No Specific Format. If you have customized and saved a format, that would also show up.

Select Manual to bring up the Edit screen. A conversational line, which gives

a filename, the page number, and the screen number is on the top line. Directly below that are two lines used for entering commands and receiving prompts and recommended responses. Finally, there's a ruler line that indicates the right-hand margin and the line spacing. The default is 76:2—meaning the right-hand margin is at 76 and the line spacing is at two half-lines (that is, single spaced).

□ **WordPerfect**

WordPerfect is essentially command driven with menus thrown in. The ten function keys and the top row of numbers are used in conjunction with the Shift, Alt, and Ctrl keys. Some commands get you into a menu and some are simply single commands. Others, such as the PRINT command, display an option line with three choices at the bottom of the screen. The 25th line of the editing screen holds a status display showing the document, page, line, and cursor position numbers. Like the other command lines and menus, this line is intensified. The Replace mode adds a replace toggle at the bottom of the screen.

□ **WordStar**

In the editing mode, an information line on top of the screen specifies the logged disk drive; filename; page, line, and column numbers; and whether Insert and Margin Release are on or off (both can be toggled manually). There is also a ruler line with tabs, which can also be toggled. Edit commands are conveyed through Ctrl-key combinations. The page and line counts can be toggled to give you file character and line numbers.

□ **XyWrite II-plus**

The working screen contains three lines at the top. Uppermost is the command line, from which you call all of the functions that cannot be performed with keystrokes from within the text. The middle line is the prompt line, which is where *XyWrite II-plus* gives you its messages, the name of the file you are editing, the page and line you are on (if desired), the status of the CapsLock and NumLock keys, whether you are in Insert or Overwrite mode, and

In 1947, 71 years after Alexander Graham Bell uttered the words "Watson, come here, I want you...", Bell Laboratories invented the transistor...and ushered in the Computer Age.

WATSON, WATCH US NOW!

AT&T INTRODUCES TH

For over 40 years, AT&T has been in the business of designing and manufacturing computers.

In fact, we've created the largest computer system in the world—our long-distance network—the one which enables you to make all those long-distance calls to your branch offices.

Today, we're proud to introduce a whole new line of flexible, compatible, reliable computers for business ...AT&T Computers.

THE FLEXIBLE FAMILY

Meet the family.

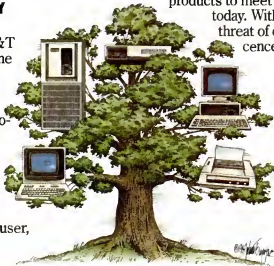

The 3B2, 3B5 and the AT&T Personal Computer make up the new AT&T family of flexible business computers.

The AT&T 3B2 is one of the most advanced super micro-computers you can buy today. This 32-bit UNIX* System V-based super micro packs all the power of a much larger system in a size small enough to sit on your desk top. Because it's a multi-user, multi-tasking computer that can accommodate up to 18

terminals, it operates at a low cost per work station. That makes it perfect for offices where many people need desk-top computers and there's a need to accommodate growth.

For larger family gatherings, the AT&T 3B5 minicomputers make great hosts, because they can accommodate up to 60 users.

What's especially attractive about our family is that it will grow with you. No matter what size your company, it allows you the flexibility to pick specific products to meet your needs today. Without the threat of obsolescence tomorrow.

E NEW COMPUTERS.

And the family's open architecture means that our computers will be good company for your current hardware and software, thus protecting your investment.

No matter which AT&T Computer you buy, consider yourself part of the family.

ALL THIS AND A PC TOO

AT&T would also like you to meet the new AT&T Personal Computer. This exciting new member of our computer clan is perhaps the most flexible and compatible personal computer on the market today.

What makes the AT&T Personal Computer special is its ability to run most popular business software, including most available MS-DOS** applications. It operates as a stand-alone unit or as an intelligent work station in an integrated computer network.

And it combines high performance with excellent graphics capabilities and a high-resolution screen.

Moreover, costly options on some other PC's are standard features on the AT&T Personal Computer—features such as color graphics; serial and parallel ports; clock/calendar display; monitor pan and tilt, plus multiple expansion slots to add extra printers, memory and other plug-in options. All this is bound to make it your personal favorite.

YES, WE DO WINDOWS

If you have several stacks of work that you'd like to spread out and work on, AT&T has the perfect way out. It's called windowing. It allows you to divide your computer screen into four miniscreens. It enables you to print from one window, edit in another, draw a graph in a third and sort addresses in the fourth. With AT&T's windowing, you'll be able to see to everything at once.

When it comes to compatibility, the new AT&T Computers hit it off with each other...and most everyone else.

To begin with, our unique PC Interface

UNIX

THEY GET ALONG

bridges the MS-DOS and UNIX Operating Systems, allowing you to use your PC as part of a larger 3B network.

All our computers are based on AT&T's Information Systems Architecture, an open, communications-based structure that can accommodate and integrate not only our products, but also those of other manufacturers.

We also have the UNIX System V Operating System, developed by AT&T Bell Laboratories. It's an operating system so flexible, it's rapidly becoming an industry standard. You won't have to discard equipment. Or waste time and money re-programming every time a new computer comes along.

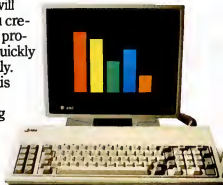

HARDWORKING SOFTWARE

For solutions to all your business problems, the new AT&T software really applies itself, with a wide range of new applications. AT&T software also offers you upward compatibility. Because it's based on the UNIX Operating System, 3B2 software will run on 3B5 computers.

It's your assurance that your software investment is protected as you grow.

We've created a Business Management Series to perform a full range of management functions from financial analysis to sales administration. The Communications Series enables your processors and terminals to talk with each other. There's an Industry Series to zero in on the needs of your particular business.

There's also an Office Productivity Series to help you with tasks like word processing, filing, and spreadsheets. And a Systems Programming Series will help you create new programs quickly and easily. Since this is just a sampling of our wares,

MS
DOS

...FAMOUSLY.

you can see why it makes sense to sign on with AT&T's entire range of software.

WE'LL MAKE YOU A STAR

The new AT&T Information Systems Network, featuring star topology, is one of the most flexible, cost-efficient links between terminals, work stations, and computers of all sizes. This local area network allows you to connect departments, whole buildings, industrial parks... or even campuses.

Information Systems Network also gives you fast response time and centralized administration and control. In addition it offers collision-free access, making it ideal for large user populations. Information Systems Network will do more than help your company keep pace with today's competitive marketplace. It will change the way you think about local area networks.

BUILT-IN RELIABILITY PLUS SERVICE

AT&T Computers meet the toughest design standards and rigorous testing procedures.

Their rugged design can adapt to any office environment without complicated powering, air conditioning or installation requirements. And they feature built-in diagnostics to find problems—and fix them—in record time.

In case you do require service, AT&T Information Systems personnel are out in force. With around-the-clock service, and one of the industry's largest service forces, including thousands of skilled technicians in over 1400 locations.

Few companies can offer you this kind of built-in reliability plus service.

So come in and meet the family: the 3B2, 3B5 and the AT&T Personal Computer. They're the answer to your business needs. For more information call your AT&T Account Executive or 1 (800) 247-1212.

CONVERT YOUR PRINTER INTO A DIGITAL PLOTTER

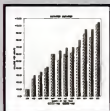

Scientific Plotting

Symbol Sets

Digitizing

Business Graphics

Program Output

Contouring

PLOTCALL is a graphics system that processes standard plotter instructions into a form that can be printed on over 20 dot matrix printers. This is not another print screen program; presentation quality graphics are created directly on the printer to achieve the maximum resolution possible. (120 x 216 dots per inch for Epson printers)

PLOTCALL includes 17 symbol sets for sign making and plot labeling. Symbol sets may be altered, or create your own! Character strings may be created from any symbol set, rotated to any angle, and scaled to any size.

Plots can be created from any language or from digitized data. An interactive plot debugging program allows you to preview a plot on the screen before sending it to the printer.

All plots in this ad were created with **PLOTCALL** on an Epson printer. No ad-

ditional hardware is required, not even the color graphics card!

Also included are the following easy to use, interactive programs that utilize the **PLOTCALL** system:

SURF creates high resolution three dimensional surface plots with hidden line removal.

TOPO creates contour maps using the same data as **SURF**. **TOPO** uses the character routines in the **PLOTCALL** system to provide inline contour labels.

GRAFIT creates charts and graphs of all types - XY graphs, bar charts, pie charts, and line graphs.

IBM PC or compatible with a minimum of 128K of memory and a dot matrix printer with graphics option are required.

ENTIRE PACKAGE ONLY \$199
DEMO DISK (include printer model) \$10

whether you have set the program to automatically capitalize the first letter of each new sentence. The third line is the help line, which can display a ruler line showing the columns, tabs, margins, and cursor position; a clean straight line; or any of *XyWrite*'s three sets of function key reminders.

ADAPTATION TO PC

(continued from page 122)

writer, German characters from the extended ASCII set will display on the screen.

□ **SELECT Bilingual**

The function keys are designed to insert ten different boilerplate phrases. No other function keys are mentioned or used.

□ **Spellbinder**

Spellbinder's use of the PC keyboard seems to be too extensive, attempting to stuff a bewildering array of commands onto the ten PC function keys, whose meanings constantly change. The function-key legend at the bottom of the screen changes to match the configurations, but it's slow to update. In *Spellbinder*'s Edit mode, it takes the better part of a second after pressing Esc for the new key meanings to update, and that will slow down a fast typist. *Spellbinder* veterans may find it faster to stick with the control-key sequences.

□ **Volkswriter Deluxe**

The program is well adapted to the PC, and the only key not used is the Scroll Lock. Colors can be used for display of special printer effects such as boldfacing, and can be configured to taste. The extended character set can be edited either by entering the character using Alt and the numeric pad, or by customizing the keyboard using the KEYBD.IN file (a table of keyboard information that comes with the program).

□ **WordMARC**

The program makes good use of the function, numerical pad, and Shift keys and special characters.

□ **WordPerfect**

WordPerfect definitely makes efficient use of the PC and the PC keyboard.

□ **WordStar**

WordStar makes effective use of both the keyboard and color once it has been installed for a color screen. The installation program, WS COLOR.BAS, allows you to tailor the program to taste.

□ **XyWrite II-Plus**

The program makes extensive use of the available keys and key combinations on the PC. The function and keypad keys are used alone or in various combinations with the Alt, Ctrl, and Shift keys; the alphanumeric keys are used with the Alt key to generate stored program or text strings. The Ctrl-Alt combination is used with some alphabetic keys for search command wild cards and with the keypad to produce the extended ASCII characters. The Ctrl-alpha key combinations also generate many of the graphics characters. If you don't want the graphics, you can (as I have done) remap the keyboard to make the Ctrl-alpha combinations (or any other keys) execute any function or combination of functions that you choose.

TEXT ADJUSTMENT

(continued from page 124)

□ **MultiMate**

To position the cursor, use the four arrow keys. Alt-F3 and Alt-F4 move the cursor to the beginning and end of the line. You can also move the cursor by word, line, sentence, and paragraph. To move cursor to the top and bottom of a file, use Home and End. A ruler at the top makes a "page" on the screen. Press F3 to center text, Shift-0 for manual underlining, Alt-0 for automatic underlining.

□ **Palcitr**

Since the default data entry mode is Change, just move the cursor to the 4 and type F. Then change mode to Insert by pressing the Ins key and type the letters our. Centering the heading is done by moving the cursor to the heading line and pressing F1 (set) and then pressing the left-

cursor key. To indicate that the heading be underlined press F1 (set) and then the underscore character (_) with the cursor at the beginning of the heading, move the cursor to the end of the heading, and then press F2 (clear). Indicating boldface is done the same way, except that the exclamation mark (!) is used.

□ **PC-Write**

Manipulating text is fairly easy in this program. The Backspace key at the top of the Return key on the keyboard is used to delete characters to the left of the cursor. Del at the bottom right does the opposite. Ins puts in spaces.

The text does not automatically realign, however. You press F7 to make that occur. Action is fast enough, though if you are used to automatic realignment you may find the adjustment hard to make.

□ **Perfect Writer**

The End key takes you to the bottom of the file. The default writing mode is Insert. To choose overstrike or to write a line longer than *PW*'s 80-character maximum display, hit Esc for the main menu, O for Operations submenu, and M for the Mode options. Hit O for Overwrite or N for "no-mode." To continue editing, press Esc.

The Home key takes you to the top of the file, and Ins opens a new line for entering text. Note that *PW*'s default setting demands a blank line between paragraphs, although you can change nearly two dozen other settings using *PW*'s comprehensive configuration routine.

To center a line place the cursor on the desired line, call the main menu and strike A (for Appearance submenu), and then, in the following submenus, type L (for line) and C (for center). Or, you can place the embedded document-design command @CENTER before the target passage.

Underlining can be accomplished through the menu chain, but striking Shift-F6, which underlines one word at a time, is faster for short passages. Boldfacing is done by typing the embedded @B command and placing the target text in parentheses, or by going through a chain of submenus in the following order: Operation, Layout, Typestyle, Boldface.

□ PFS:WRITE

Normally, **PFS:WRITE** is in Overtyping mode. When in Insert mode, the cursor changes from a blinking underline to a blinking box. Home and End move to the ends of the file. PgUp and PgDn move a screenful, and the function keys move ahead or back a word, or to the beginning or end of a line. Del deletes the current character; Backspace deletes to the left. A status line at the bottom indicates the page and line you're on, and page breaks are shown by the boxes that simulate an electronic page.

F8 formats individual lines centered, left or right, so it's possible to have an entire file right justified, if you have the time and inclination to redo every single line.

To underline text, type the text in, then go back to the beginning, press Shift-F7 and hold the two keys down until the text is all underlined. Shift-F8 does the same with boldface. To undo underlining or boldface, you must retype the words.

All editing is done by function keys, which include: set tab stops, move left or right a word, label (define) blocks of type for duplication or removal, search and replace, format (align a single line left, centered, or right), append (add) another file, delete by word or line, and underline or boldface. The maximum character width per line is 78, and a document can be about 15 single-spaced pages. Back up a few lines, press Ins, add a word, and **PFS:WRITE** automatically adjusts the rest of the paragraph.

□ ReadWriter

Position the cursor using the cursor control keys. When the cursor goes off screen to the left or right, the view jumps 40 columns. When the cursor goes off the top or bottom of the screen, the view scrolls a line at a time. Enter adds a line and takes you to the beginning of it. PgDn and PgUp show you the next and prior 20 lines of text, respectively. Home takes you to the beginning of the current line, and End brings you to the end. You can also move the cursor to the top and bottom screen edges and to the first and last lines in the file.

Groups of lines can be centered using the :center tag to start and the :center (end center) tag to end.

Three levels of highlighting are defined. When you set up your printer configuration file, you'll tell **ReadWriter** what control character sequences the three levels correspond to. When you're entering text, surround the highlighted portions with ":hpn" and ":ehpn" tags (where *n* is 1, 2, or 3). On my system these come out as underlined, boldface, and underlined boldface.

□ Samna Word III

Generally the program is pretty good about getting the cursor around the screen, although you can't page through a document by screenful. You have to move through a file either by paragraph or by page break. If you move by word or by sentence, the cursor will not stop at the end of the text, but will bounce past the end of the last line and end up in the first column of the (blank) line below. You have to fiddle with the arrow keys to get back to a position where you can start creating more text. The **MOVE-BY-FILE** command will put the cursor at the end of the last line of text, but it bumps the whole text up into the top quarter of the screen, so you can't see much of what you've already written.

Hit the plus sign (on the number pad) to get to the end of the file. Hit Shift-PgUp to move backwards one sentence to the "4." Type F in place of the 4, and the program will overwrite. Hit Ins to turn on Insert mode. Type the letters *our* and then hit Ins again to get out of Insert mode. The paragraph will automatically reformat.

To center, move the cursor to the title line. Hit F4, "highlight" the line, and press Enter. To underline, hit F1, highlight the line, and press Enter. To boldface, hit F8, highlight the line, and press Enter.

□ SELECT Bilingual

Press X to enter data in Exchange mode (replace or overtype), move the cursor to the 4 and type F. Then press Esc to get back to the editing menu, press I to enter data in Insert mode, move the cursor after

the F and type *our*. To center the heading, insert a line that says \C immediately in front of it and a line that says \JN immediately after it. To highlight text, move the cursor to the beginning of the text, press U from the editing menu to invoke the USE command, press B for Boldface or U for Underscore (or both), move the cursor to the end of the area to be highlighted, and press Enter.

□ Spellbinder

Overtyping is the normal editing mode. To insert, press Ins and half the screen opens up as a yawning blank, even if you are inserting only a single character. Press Ins again and the text closes up. If you make a mistake inserting, go back and overtype the rest of the line or exit the Insert mode, and then re-enter the text. Cursor movement includes the cursor keys, PgUp and PgDn, End (end of the file), left side-right side of line (Home pressed repeatedly), center of the line (hit Esc and then F6), and back and forward (F9, F10) by the current text mode—a character, word, sentence, paragraph or mark—or by a specific number of lines.

To center, use a dot command, a period followed by the letter C and the text line to be centered. Groups of lines can be centered by reading the Y Table into text in the form of an extended dot-Y command and numbers corresponding to the Y Table settings. This technique also works for running margin changes, justification changes, and so forth, throughout the file.

Highlighting is controlled by the Y Table, too. You get a choice, which includes Underline, Doublestrike, Bold, Overstrike, but only one at any time. Unfortunately underlined boldface isn't possible. F7 and F8 turn the Enhance function on and off.

□ Volkswriter Deluxe

To move to the beginning or end of the file, use Ctrl-Home (or press Home, Home, Home), or Ctrl-End (or Home-End). F3 toggles the cursor from the right to the left of the line, pressing Home twice takes it to the top left of the screen, End brings it to the bottom left of the screen,

Home and an arrow key puts it at the far edge of the screen, and Home with a down arrow moves the cursor to the bottom of the screen in the same column. To center lines, press Alt-F9, Shift-F9 to underline, and Shift-F7 to boldface.

☐ **WordMARC**

To select the end of the document, press 5 on the keypad, the bottom key and type the new paragraph. The line folded at the preset right margin. Then position the cursor on the 4 and hit the Ins key, type Four, hit the execute key (to close the inset), then do a forward delete to get rid of the 4. (WordMARC defaults to the Replace mode.)

Press the Shift keypad 5 simultaneously to get to the top of the document, hit the Ins key, and type "Lincoln's Gettysburg Address," followed by two carriage returns. Hitting the Execute key closes up the insert.

At the bottom of the text, overtype the last *people to men*, then do a forward delete to get rid of the *ple*.

Then hit Shift and the keypad 5 simultaneously.

Return to the top of the document, (keypad 5) and overtype "Lincoln's Gettysburg Address" in all caps. No command to convert upper and lowercase is available in the Edit mode, although the Print mode has a feature that will force all characters to uppercase for printing purposes.

To move to the top of the page, place the cursor at the beginning of the title line, and press the Bold function key and Center function key. To boldface and underline, select the block to be acted upon by placing the cursor on the active text, then do a quick search for the end of the block.

☐ **WordPerfect**

Word Perfect is fairly adept at easily getting you to any point in the document. Depressing the Home key twice and then hitting the up arrow key takes you to the beginning of the document. Hitting the Home key twice followed by the down arrow key positions the cursor at the end of the document. A single hit on the Home

key with the corresponding arrows takes you to the top and bottom of the screen. You can also move by word (Ctrl-4 and 5), screen, and page (Minus and Plus keys) in both directions. A GOTO function takes you to any page by pressing Ctrl-Home and then the page number.

☐ **WordStar**

To move the cursor to the beginning and end of the file, hit Ctrl-QR or Ctrl-QC, respectively. The cursor can be moved by character, word, line, or screen. Landmarks can also be embedded in the text. To center lines, hit Ctrl-OC. To underline, hit Ctrl-PS before and after the desired text. To boldface, hit Ctrl-PB in the same manner. Control characters on screen will indicate where the change has been made.

☐ **XyWrite II-plus**

When working in a file, you can not only enter the regular alphanumeric data, you can issue all editing commands and most character display commands with key combinations without leaving the text. (Text formatting commands are issued from the command line.)

Cursor moves are, with two interesting exceptions, controlled by key combinations without leaving the text. The keypad arrows alone move the cursor up and down a line or forward and back a letter. The Alt key with the horizontal arrows moves it a word at a time. Functions are available to move it a sentence or a paragraph at a time. Ctrl-Home or Ctrl-End move to the top or bottom of the file, and the PgUp and PgDn keys move up or down one screenful. In addition, you can give two commands (JUMP and GO) from the command line, and the cursor will jump to the indicated character of the file or go to the indicated page and line. All of these moves are essentially instantaneous, since XyWrite holds everything in memory (if you have enough); there are no delays, even with large files.

Entering highlighted text (such as underlined or boldfaced), subscripts or superscripts has been made extremely simple. If you are keying the text in for the first time, you hit one of the number keys

with the Ctrl key and keep typing. Ctrl-2 is Bold, Ctrl-3 is Underline. When you want to return to normal mode, hit Ctrl-1. If the text to be highlighted has already been typed in, simply define the desired text and hit one of the Ctrl-number key combinations. These commands can also be implemented by going to the command line and giving one of the MODE (or MD) commands. The effect is the same in either case: program response is virtually instantaneous.

SEARCH AND REPLACE

(continued from page 128)

replacement to take effect and whether *Palantir* should automatically continue through the file replacing each found string. You can replace strings one at a time, replace a certain number of occurrences, or replace all strings found in the file. There is no command to change the case of a character string.

☐ **PC-Write**

Press the F9 key to enter the Find mode. The prompt in the status line at the top will ask for the string of characters to be searched for and the replacement string. To effect a search only, press the plus sign (+) key.

To replace the character string with the replacement string, press the F10 key. To effect a global search and replace routine, press Shift-F10.

☐ **Perfect Writer**

Place the cursor above the area to be searched, press the Esc key to call up the main menu, and choose the following options from the chain of submenus: Search, Replace, and Every One. PW prompts for both the search and replace strings in a highlighted window and makes the changes automatically. If search strings are entered in lowercase, the program will ignore the case of the target words; if search strings are entered in uppercase, the program will find exact matches only.

☐ **PFS:WRITE**

Press the F7 key and type the search

string. Choose either the Manual or Automatic option for replacing the string. If you choose the Manual option, the file scrolls along until a match is found, at which point you're asked if you want to make the change. *PFS:WRITE* matches whole words without regard to variations in capitalization. Searching for *country* also finds *Country* and *COUNTRY*. Wild card searches are possible by using two periods. For example, if you want to find word groups beginning with *country*, ending with *country*, or with *country* in the middle, your search string would be *country . . . country*, or *. . . country . . .*, respectively.

□ **ReadiWriter**

ReadiWriter has neither search nor search-and-replace functions. To replace text you must re-enter it.

□ **Samma Word III**

To change the last occurrence of the word *people* to *men*, move the cursor to the first letter in *people*. Press the Del key to get into Delete mode. Press the Home key to move the cursor forward by one word (this will "shade" the word *people*, that is, put it in reverse video). Press the Del key again to delete the word and then wait for the paragraph to reformat. Press the Ins key to get into Insert mode. Type the word *men*. Press the Ins key again to get out of Insert mode and reformat the paragraph.

To search for *country* and replace with *nation*, press F9, the letter S (for search), type *COUNTRY*, and press the Enter key. A menu with four options will appear on the screen. The Generic-or-Exact option gives you the choice of searching for any occurrence of the string, whether capitalized, boldfaced, italicized, and so forth, or of searching for the string as typed. In this case, choose Generic to be sure to pick up the occurrence of *Country* in which the letter *c* is capitalized.

The Any Occurrence/Whole Word option allows you to limit the search to whole words or to include strings that are embedded in other words. In this case, choose Whole Word.

The Replace (Y/N) option lets you tell the program if you want to replace the

specified string with something else. In this case, press Y.

The Forward/Backward option lets you specify in which direction to search. Since you are at the top of the file, press F. (These option choices will remain the same after you specify a search procedure. If you don't need to make any changes, just hit the Enter key when the menu appears.)

The program then prompts you for the replacement string; you type the word *nation* and press Enter. Another menu appears with two replacement options. The Generic/Exact option lets you replace target strings either as they are found or exactly as the replacement string is typed. Choosing Generic replaces the capitalized occurrence of the letter *c* in *Country* with a capital letter *N* in the word *Nation*.

Assisted (Y/N) option gives you the choice of having the program do all the replacements at once or wait for you to approve each change. Press the N key. When you are finished with the options, you press Enter and the search and replace routine will execute.

□ **SELECT Billingual**

To start the search and replace routine, press R (for Replace) from the Edit menu. Enter the search string and press the Enter key. You are then asked for a prompt option. If you press the Enter key again, you will be prompted for each string found. If you press P, all found strings will be replaced. If you press P and enter a number, all found strings up to that number will be replaced. *SELECT* always ignores the case of the search string when making a search. The REPLACE subcommand is powerful and more than adequate. You can request a review of each change before it is made, or you can give a maximum change count. The case of the search string is ignored here, too.

□ **Spellbinder**

While in the Edit mode, press F1 (to toggle from Edit to Command mode), then F8 (to call up the Text mode), then press the function key pertaining to the Search function you want. Then type the strings to be searched and replaced. The function

choices are straightforward: Search, Search/Replace, Manual/Automatic, Once/Whole File, Whole/Partial Words, and Ignore/Distinguish between upper-and-lower case. Searches can be conducted from the cursor position to the end of the file, or through the entire file. Matches are underlined by the blinking cursor. *Spellbinder* does not preserve case—that is, it will not replace a capitalized word with a capitalized word, a lowercase letter with a lowercase letter, and so forth.

□ **Volkwriter Deluxe**

Pressing the Alt-F7 key combination invokes the REPLACE command. The program asks "ALL? (Y/N)." If you want to conduct a global operation, press Y. The program will not ignore the case of a search string.

□ **WordMARC**

Press F9 to invoke the SEARCH command. Answer the prompt "Search for what?" by typing *COUNTRY* and "Replace with" by typing *NATION*. Pressing the plus sign (+) key twice invokes the No-stop (global change) option. *WordMARC* will not preserve case in the one instance where a capital letter *C* appears in *Country*.

□ **WordPerfect**

WordPerfect will execute search and replace routines with or without a Confirm option. Searches can be conducted in either a forward or backward direction. After each search, the last string searched for remains in memory. This way, the next time you ask for a search the string doesn't have to be entered again. To execute a search and replace routine, simply press Alt-F2 (for global operation) or Ctrl-F2 (for the Confirm option). Enter the search word or string and press the Esc key. The screen prompts you for the replacement string; after entering it, press the Esc key again.

□ **WordStar**

To initiate a search and replace routine, press Ctrl-QA. The program asks you for the search string and what you want to

Teleservice Telesupport

Micro Flash is Reliable

- In our 4th year of business (*One of the Originals!*)
- Positive buying power within the industry meaning well-stocked inventories and a consistent supply
- A reputation as specialists in the business and corporate marketplaces
- A dedicated approach to honest customer service

Micro Flash Guarantee

- We sell the latest versions
- We support what we sell
We won't tell you to call the publisher or manufacturer for after-sale support.
We want you to call us!
- We won't sell you anything we don't think you need
- If the product is defective when you receive it—we'll replace it!

Micro Flash Terms

- MasterCard or VISA—no no credit card surcharge added
- Mail Orders accompanied by certified or cashier's checks
- Call our Credit Manager for information on institutional purchase orders
- All returns must have a Return Authorization Number
- \$100.00 minimum order
- Products and prices subject to change without notice

AND NOW, BESIDE COMPAQ, SPERRY, COLUMBIA, CORONA, AND ZENITH, TOO.

Beside Your IBM PC Or XT, The Best Box You Can Buy.

The Bernoulli Box™: The Superior Storage Solution.

For owners and users of the IBM PC, XT, COMPAQ, Sperry, Columbia, Corona, and Zenith micros, where to put and secure the substantial amounts of data they are processing can get to be quite a problem.

Well, IOMEGA has quite a solution. We call it The Bernoulli Box.

Hard Disk Performance And Reliability. Flexible Disk Economy And Convenience.

The Bernoulli Box is a mass storage system that uses 10-megabyte removable cartridges to deliver incredible versatility and virtually unlimited storage capacity. Powerful primary storage. Quick and efficient backup. With the performance, data integrity, mechanical reliability, and low cost per megabyte equal to Winchester hard disks.

A Handful of Cartridges Or A Desktop Full Of Hardware. You Decide.

The bottom-line beauty of The Bernoulli Box is that when you need more mass storage, you buy more cartridges—not more iron. So you save space, time, money, and get higher performance and a more reliable storage solution to boot.

Check Out The Bernoulli Box Today.

Computer dealers know a good idea when it comes around. Many are currently stocking The Bernoulli Box in both single- and double-drive models.

For the dealer nearest you, contact IOMEGA at (801) 776-7330.

IOMEGA Corporation
1821 West 4000 South
Roy, Utah 84067

replace it with. It also gives you a short list of options. For each replace, press Y (for yes) or N (for no). *WordStar* will not perform global operations unless you press G (for global search) at the list of options.

□ **XyWrite II-plus**

There are four Search options: Search forward, Search backward, Case-sensitive, and Ignore case. There are also four Replace or Change options: Change all automatically (ignoring case); Change all automatically (case-specific); Change all (ignoring case, asking for verification of each one); and Change all (case-specific, asking for verification of each one). The command format is SE, SB, SEA, SEBA, CH, CV, CHA, or CVA followed by /string/ in the case of a search, or /string1/string2/ for a change. The string separator can be any displayable character that is not included in either string (which means if your string contains a slash, you can use a different character). Wild card searches are possible, but wild card changes are not. The wild cards may include symbols for a number, letter, alphanumeric character, any ASCII character, or any string of up to 80 characters.

BLOCK MOVES

(continued from page 130)

with groups of lines, sentences, and even individual characters.

□ **PC-Write**

Block moves, deletions, and copying are quick. To move a paragraph, place the cursor at the beginning of the paragraph, press F6 to mark it, hit Ctrl-PgDn to move to the beginning of the next paragraph, and hit F6 again to end the block. The text will be nicely highlighted in inverse video. Move the cursor to where you want to insert the block. Once there, press F4 and the move is made.

It is just as easy to copy or delete. All such copy manipulations begin with F6, which marks all text to be moved, and then you use F4 to delete (Shift-F4 brings your deleted material back) or F3 to copy.

Other text manipulation is simple. To

get boldface, press Alt-B. A smiling face appears on-screen to mark the portion of text. (You can make the smiling face and other marks for special functions disappear by pressing Alt and the space bar.) You then go to the end of the text you want boldfaced and press Alt-B again. The same procedure is used with Alt-U for underlining, Alt-P for pica spacing, and Ctrl-P to force a new page. You can also change all lower-case letters to caps by using F8, and vice versa. There are other key combinations for transposing letters.

□ **Perfect Writer**

To move a paragraph, place the cursor on it, call the main menu, choose the Cut submenu, and strike P for "paragraph." The paragraph disappears into the program's delete buffer, and a plus sign (+) appears on the status line to remind you. Move the cursor to the new location, type Esc for the main menu, and strike P for "paste." The paragraph is reinserted and the plus sign is canceled.

To move a sentence, place the cursor on it and follow the same procedure used to move a paragraph, but when the Cut menu comes up, strike S for "sentence."

□ **PFS:WRITE**

Blocks of type are copied, moved, or deleted with the F5 key. Go to the beginning of the block, hit F5, and use the cursor to define the block, which will become marked in inverse video. To copy the block, press F6 (the Duplicate key), go to the new location, and press F6 again. To move a block, hit F5, define the block, and press the Del key (this takes an act of great faith the first time it's done) and the block disappears into a 35-line buffer. Press F6 after moving to the new location and the block reappears. If you accidentally put another block into the buffer, the first block is erased for good. For shorter deletions, use Shift-F5 or Shift-F6 to delete a word or line. Copying by column, or copying a block of text to another file, is beyond this program's abilities.

□ **ReadiWriter**

ReadiEdit has no block capabilities.

□ **Sanna Word III**

Put the cursor at the beginning of the last paragraph. Hit the Del key to turn on the Delete mode. Hit the End key to "shade" the following paragraph. Hit Enter, and the shaded text will disappear. Then hit Shift+ (the plus sign on the number pad) to move the cursor to the beginning of the file. Move the cursor to the new location and hit Ctrl-Ins; the paragraph will reappear after the cursor.

To reverse the order of the last two sentences in the document, hit the Del key to turn on the Delete mode and hit Shift-PgUp to "shade" the sentence in front of the cursor. Hit Del again to remove the sentence and get out of Delete mode. Hit Shift-PgUp again to move the cursor to the beginning of the previous sentence, and hit Ctrl-Ins to insert the deleted sentence after the cursor.

□ **SELECT Bilingual**

Blocks are defined by moving the cursor to the beginning of the block, pressing P (for Pointer) from the editing menu, selecting a number from 1 to 8 (which will represent this particular point in the text), moving the cursor to the end of the block, pressing P from the editing menu again, and selecting another number to represent the end of the block. To move a block, position the cursor to the target area, press M (for Move), press the number corresponding to the beginning of the block, and press the number corresponding to the end of the block.

□ **Spellbinder**

Blocks that correspond with any of the text modes (character, word, sentence, paragraph, or mark, which can be used for anything you want) can be moved. F6 rotates between the text modes, then Esc-F7 marks the text and sends it to a buffer, and Esc-F8 moves or copies the text. The text stays in the buffer until overwritten. To delete text, choose the desired text mode and press F8 (delete). *Spellbinder* politely asks, "Is this correct?" if the block is more than two lines. Other major changes, such as deleting the entire file from RAM, are preceded by the "Really?" prompt. Columns can be copied or

deleted by calling MOVEIT, one of *Spell-binder's* macro files, and then answering the menu prompts. Another command allows the entire file or a specific number of lines to be written out or read in another file.

❑ **Volkswriter Deluxe**

To mark a block, use the F5 and F6 keys at the beginning and end of the file, respectively. Then press Alt-F6 to copy, Alt-F5 to move, or Alt-F8 to delete.

❑ **WordMARC**

Scroll down using the quick-scroll feature (PgDn followed by the Enter key). Press the Move function key and respond to the prompt by placing the cursor on the beginning of the paragraph. Then do a quick search for the next carriage return, which indicates the end of the paragraph. Press the Execute key, which generates the prompt "Move to where?" and move the cursor to the beginning of the text. When the Execute key is pressed again, the last paragraph will be moved to the beginning of the text. The above procedure is also swap the second and third sentences of the last paragraph.

❑ **WordPerfect**

Block moves are fairly straightforward. Press Alt-O to define either the beginning or end of a block. Then move the cursor to the other end of the block and press Alt-9. Select the cut option from the submenu that appears, and then position the cursor where you want the text to be entered. Then press Alt-9 again and choose the Retrieve Text option; the block will be placed where the cursor is positioned. In addition, there is yet another option, and in this case marking the block is not necessary. Move the cursor to the sentence or paragraph that you wish to cut and paste, and press Alt-9. Choose the Cut or Copy option, and a submenu with Sentence, Paragraph, and Page options appears. By choosing one of these options you can get instant results.

❑ **WordStar**

Mark the beginning and end of a block with Ctrl-KB and Ctrl-KK, respectively.

Move the cursor to where you want the new copy to appear, and hit Ctrl-KC to copy, Ctrl-KV to move, or Ctrl-KY to delete. Ctrl-KH will toggle the highlighting of the block.

❑ **XyWrite II-plus**

Text in general is copied, moved, or deleted by defining it and then giving the MOVE (F8), COPY (F7), or DELETE (Alt-F6) command. The following commands are for defining text: WORD (Alt-F4); LINE (F4); SENTENCE (Ctrl-F4); PARAGRAPH (Shift-F4); TEXTBLOCK (F1 at the beginning and end of the block); COLUMN (Alt-F1 at the beginning and end of the column). As with most of XyWrite II-plus's functions, block moves are virtually instantaneous.

PARAGRAPH FORMATTING

(continued from page 134)

❑ **PC-Write**

To format a paragraph, first you insert a ruler at the top of the page by pressing F2. Mnemonic keys are used for the actual formatting: L sets the left margin, R sets right margin, P sets paragraph indentation, and T sets the tabs. You can even add a bell by pressing B.

Justification, which appears on screen, is accomplished with Shift-F7. Though the text doesn't realign after insertions and deletions are made, a quick press of F7 will realign it. Using F6, you can justify as many single lines as you wish simply by marking them.

❑ **Perfect Writer**

There are two ways to format *Perfect Writer*. You could alter each parameter separately by working through the appropriate menus and submenus. However, it is often preferable to use the @STYLE designator. Type

@STYLE

at the top of the file, followed by a command chain. In this case:

@STYLE (left margin 20
chars, right margin 60 chars,
indent 5 chars)

The program reformats a single paragraph when you use the FILL command from the menu or hit F9. It allows a preview of the entire text format when you use the @STYLE command and choose the Preview On Screen option from the Print menu.

The fastest way to get right justification is to precede the target section with the string @@STYLE (right justification is the command default). You can also justify with menus—from the Operations submenu, hit M for Mode, and from that submenu choose J for Justify.

❑ **PFS:WRITE**

Paragraph formatting in *PFS:WRITE* is entirely automatic—provided you don't get too tricky. Margins are set from the main menu's Define Page option. Then press F10, wait a few seconds, and the entire document is reformatted. However, the entire file must be one width. Tab stops are set by pressing F2, scrolling along the ruler line, and typing T or D for regular or decimal tab stops as needed.

❑ **ReadiWriter**

Paragraph formatting is done at text-formatting time by *ReadiWriter*. To indicate that you are starting a paragraph, use the :p. tag. You can set margins using :set leftmar 10 linelen 65, paragraph indent using :set paraindent 5, and justification using :set justify on. Groups of lines can be right aligned with

:right to start

and

:right to end,

and there's a similar pair for left alignment.

❑ **Samna Word III**

To change the margins, first hit F7. This moves the cursor to the ruler on the third line. You then use the right and left arrow keys to move the cursor along the ruler. When the cursor is where you want it, hit L for left margin, R for right margin, T for tab stop, or N for numeric tab stop. (A numeric tab lets you enter a column of

...SORRY CHARLIE
FOR LEAVING
YOU OUT!

FEATURES

INCLUDE:

IBM® COMPATIBILITY AFFORDABLE PRICE TAVA PC

THE SMART COMPUTER USER
WANTS REAL VALUE WITH
IBM COMPATIBILITY!

THE TAVA PC. The ultimate Personal Computer. It gives you IBM PC® Compatibility at a fraction of the cost. Choosing a personal computer is a difficult decision. But, when your decision is a TAVA PC, it's not hard at all! The TAVA PC runs under DOS 1.1, 2.0, CP/M86®, and p-System®. You can choose from a large library of all the most popular IBM PC software products such as dBase®, Lotus 1-2-3®, Visicalc® and thousands more.

CP/M86 is a registered trademark of Digital Research, Inc.
Visicalc is a registered trademark of VisiCorp.

IBM PC is a registered trademark of IBM Corp.
Visicalc is a registered trademark of VisiCorp.

INTRODUCING PINWRITER DOT MATRIX PRINTERS. AND A HEAD TO HEAD COMPARISON OF WHY THEY'RE BETTER.

Our new multi-mode Pinwriter® dot matrix printers have a lot in common with our Spinwriter® letter-quality printers. Designed and manufactured with the same quality and reliability that has made our Spinwriters the best selling letter-quality printers to PC users. We also gave them many unique capabilities you won't find on other dot matrix printers. Especially at such an affordable price.

More dots, more fonts, more versatility.

One thing that makes Pinwriters stand out from other

Our exclusive 18-pin print head is graphically sharper than a 9-pin printer, as this unretouched photo shows.

dot matrix printers is our printhead. It has 18 pins. Compared to the usual nine. It also has true dual-pass printing. The result: an amazing 240x240 dots per inch.

The quick brown fox

The quicker brown fox

The quickest brown fox

Three speeds cover all your printing needs.

That's why the print is as close to letter quality as you can get without getting a

Spinwriter. And why charts, illustrations and graphics look so crisp.

Our new P2 and P3 dot matrix printers give you everything our Spinwriter letter-quality printers are famous for, including forms handlers.

Pinwriters have something else no other dot matrix printers have. Eight operator-selectable print styles, plus as many as 11 international character sets. And an LED display to tell you which style has been selected.

What else? Three printing speeds. 300, 900 or 1800 words per minute to handle all your printing needs from word processing to data processing.

Plus, a variety of forms handlers to speed up all your paperwork. All made and designed by NEC. And all easily installed and changed by the operator.

For the final word, see your NEC dealer.

Only a demonstration can

Pinwriter and Spinwriter are registered trademarks of NEC Corporation.

show you how clearly superior the Pinwriter is compared to other dot matrix printers. And how versatile it is.

For the Pinwriter retailer nearest you, call 1-800-343-4419. In Massachusetts call 617-264-8635.

And find out why more and more PC users are saying, "NEC and me."

numbers easily by lining up decimal points for you.)

Samna Word II automatically reformats as soon as you have done an insertion or deletion. This is annoying because you have to wait for the process to end before you can do anything else. If you have more than one deletion or insertion, you will quickly get ahead of the program.

There is no flush-right command. You would have to insert spaces at the beginning of each line to make it flush right.

□ **SELECT Bilingual**

Paragraphs are not formatted on screen. To indicate how they should appear when printed, insert format codes in front of the first paragraph. For instance, to set margins at 20, 60, and 26 (for a first-line indentation), your format code line would say `VL20,R60,I26`; to indicate that spaces should be inserted to make the right edge of the text flush with the right margin, use the code `VR`.

□ **Spellbinder**

Formatting is accomplished by a Y table, so named because Ctrl-QY calls the formatting table, or menu. On the PC, it could also be called the F1-F10-F1 table, because that's the call sequence. The Y table controls page length, text lengths, left indent, line width, line spacing, margin justification, and proportional spacing. A YT table controls titles, page numbers, top and bottom margins, and odd- and even-page margins (page offset). A third menu sets tabs. A VERIFY command reformats text temporarily on-screen; final formatting occurs at print time. Help with hyphenation is also available.

□ **Volkswriter Deluxe**

To set the margins, press F9 and move the cursor along the ruler to the new margins. Type a backslash (\) at the left margin, a slash (/) at the right margin, and a plus sign (+) for a tab stop. Press F9 when you're done. The program reformats on-screen; you press F8 for each paragraph to be reformatted. To produce a flush-right edge, press Ctrl-F1 to go to the format menu, modify the right justification, and press U to return to the text. The justifica-

tion does not show up on-screen.

□ **WordMARC**

To format text, place the cursor on the ruler bar and hit the Format key (Scroll Lock/Break). Margins are placed by moving the cursor to the left margin position and hitting the Indent function key and then moving the cursor to the right margin and hitting the Return Key.

□ **WordPerfect**

Press Shift-F6 to get the Set Format option line, which lets you set the tabs, E-tabs, margins, spacing, and H-Zone. Select "margins," and you are prompted to enter the left, and then the right margins. Pressing number 3 shows you what has been previously set. All format settings are independent for each file, but toggles (such as automatic widow and orphan protection) must be set each time, or preset with the start-up program. For flush right hit F7, for centering hit F5, for underlining strike F8, and for boldface tab F6. Right-hand justification does not show up on the screen. To show embedded commands, press Shift-F2. You can then find them with the search command anywhere in the text and delete them with the Del key.

□ **WordStar**

To set margins, hit Ctrl-OL for the left margin and Ctrl-OR for the right margin. The program reformats on-screen when given a Ctrl-B command. Ctrl-OJ toggles the right justification on and off.

□ **XyWrite II-plus**

Formatting commands, such as margins (RM or LM), ragged left/right or centered (FL, FR, or FC), paragraph indent (IP), and so on, are all given from the command line with two-letter commands that embed a small bright triangle in the text at the place where the cursor was when the command was issued. This way, the screen is not cluttered with confusing alphabetic commands that are not actually part of the text. If you want to see what a particular triangle stands for, place the cursor on it, and the text of the command will be displayed on the prompt line. To see all of the commands on a particular screen at one

time, go to the Expanded Screen mode by hitting Ctrl-F10. This instantly converts the screen to a standard, unformatted mode with all of the embedded commands written out, enclosed in European-style double brackets. You can then edit these commands directly, rather than having to delete them and re-enter them from the command line. Hitting Ctrl-F10 again converts the screen back to the formatted mode. Formatting commands can be changed at will; the text will reformat instantly, as when text is inserted or deleted.

SAVING THE FILE

(continued from page 136)

You can't change the name of a file that is already in the editor. You must save it under its current name (Press F1, then Enter) and then do a directory of the data disk (Press F1, D [for Directory], and Enter).

To rename the reformatted file to GET-TYSBU.RG9, use the arrow keys to move the cursor under the old name of the file. Then hit F9, the plus sign (+) (on the number pad), R (for Rename), and then Enter. The program will prompt you for the new name for the file; type it in and press Enter.

□ **SELECT Bilingual**

To save the file, you press Q (for Quit) from the editing menu and select the Keep option. You can't continue to edit the file after saving the file to disk. If you want to save the document under a new name you have to have given the new name when you issued the EDIT command.

□ **Spellbinder**

Saving the file consists of both writing the file to disk and closing the file; other word processing programs do this as a single task. Novices may lose their text a few times until they figure out which of the 14 commands they need and when. Multiple saves will create a .BAK file.

□ **Volkswriter Deluxe**

To save the file, press Alt-F10 go to the main menu and S for save. The program will ask if the filename is satisfactory.

WordMARC

You can't save a file without exiting. Select the File function key, which will return you to the main menu. Select the RESAVE command. Next, select Edit from the menu, and the system will propose the correct filename. Press Enter and you'll be returned to the document. (WordMARC automatically saves every 12 or so lines and has a data recovery utility, so the save and resume feature need not be worked manually.)

Next, using the Move function key again, select the first paragraph. Then hit the File function key and go to the "move out" mode. I answered the filename prompt with "Gettysbu.rg1" and hit Enter, which saves the selected portion of the file.

WordPerfect

To save a file press Alt-8 and give the name at the prompt; then press Return. Additionally, the last name you saved will automatically be remembered and displayed the next time you hit Alt-8. This way you don't have to keep typing in a long name each time you want to save a file. In this case, you will be prompted to enter a Y/N to the prompt "Confirm Replacement ----?"

WordStar

To save a file without exiting, hit Ctrl-KS; to save it, exit to the main menu, and hit Ctrl-KD. To save it and exit to DOS, hit Ctrl-KX. If the file was opened in a document mode, WordStar stores information in the eighth bit, which can be confusing to other word processors. This can be avoided by using the nondocument Edit mode.

Xy Write II-plus

To save a file, you have two options. To continue to edit after saving the file, enter SA (for Save) on the command line and hit F9 or Return. Since Xywrite does not remove commands from the command line after executing the command, your subsequent saves can be executed from within the text simply by hitting F9 whenever you wish. This makes it extremely convenient to do the frequent saves. If you

want to save the file and stop working with that document, you enter ST (for Store) on the command line and execute the command by hitting either F9 or Return. With the program's default setting, it will create a backup file in either case; you can reset it so that no backup is made, if you wish. You can also do intermediate saves to another drive by adding the drive designation and the filename after the SA or ST command. To save a portion of a document to a different file, just define the portion and give the SA or ST command with the desired drive and filenames.

PRINTING THE FILE

(continued from page 140)

All the commands are embedded in the editing file and "read" to the print file. They number about three dozen standard commands, such as .M2, for example, which tells the printer that you want double spacing.

Perfect Writer

Choose Print from the main menu or the Documents submenu, and Perfect Writer automatically saves the file to disk and displays a list of print options. The user specifies variables such as type of sheet feed, number of copies, and page numbering—Perfect Writer prints numbers centered at the bottom of the page—and type S to start printing. The single-space default is altered using @@STYLE commands followed by the desired line spacing in parentheses.

PFS:WRITE

To print the file, choose the main menu Print option, change the defaults if desired, and press F10 to begin. If no file is specified, the text in RAM is printed. Top and bottom margins, single or double spacing, and headers and footers are entered via the Define Page option. Triple spacing and 1½-line spacing aren't possible. Page numbers are allowed in the footer but not the header; PFS:WRITE assumes a number in the footer is the page number and increments it by one per page. So, if you have a footer reading, "Marketing History of the BMW 320," the sec-

ond page will read "Marketing History of the BMW 321." If your file is single-spaced, what you see on-screen is what you get; if it's double-spaced, the only way to preview page breaks is to print to disk and then view that file from DOS. Just about any printer works without special installation, since PFS:WRITE does nothing trickier than going over a line twice to underline or doublestrike a character. Fancier printer commands can be entered in with the text by typing

PRINTER xx

where xx is the ASCII code for a special printer feature.

ReadiWriter

Request triple spacing by inserting into your text this format command

```
:set linespace 3.
```

To put the page number on the right of the header line, insert

```
:hr.Page *
```

after the first page has already started so that it won't appear on page one. Once you have finished inserting format commands (ReadiWriter documentation refers to these as tags) into your document with ReadiEdit or any other text editor, you can execute the ReadiWriter program using the name of your source file as the first parameter.

Samna Word III

First, put a page-number marker in the text at the point where you want the page numbers to appear. Move the cursor to the top right-hand corner of the page and hit Scroll Lock, the number symbol (#), and Enter. The number symbol will appear at that point on the screen. To print, first save the file to disk. Then hit F3, the plus sign on the numeric pad, the name of the file to be printed, and Enter. You will now get a menu of print options. Select the Repage option to print the document in triple space instead of single spaced as it was on the screen. You also select the Print Page Numbers option and the More Options option to take you to the next print options menu. Here, you specify on which page to

Qubie' gives you the three Pluses: Quality, Service, & Low Prices

We were tempted to headline this ad with "The 1, 2, and 3 of why you should buy AST from Qubie." We are tired of ads with that logo as you are, so we settled on three pluses. Actually, the plus really tells it better. The AST Research plus of quality is the reason they have the number one expansion products for the IBM PC. The Qubie Plus of service has made us the largest AST dealer. You don't supply the likes of IBM, Exxon, General Motors, and Lockheed, unless you have premier products and service. Top it all off with low Qubie prices, and you have the reason tens of thousands of corporations, institutions, and PC owners have come to Qubie for their expansion needs.

Take Your Choice

We have the range of multi-function boards for IBM PCs and compatibles that gives you the choice of functions right for your needs. The AST Research MegaPlus II™ is the most flexible expansion product available for the PC. It's younger brother, SixPacPlus™ is the standard the competition measures themselves against. I/O Plus II™ is the answer for those who need serial and printer ports and automatic time and date loading, but already have their memory needs satisfied. MonographPlus™ is a multi-function monochrome graphics board. It offers the high resolution of the IBM monochrome board, along with flicker-free 1-2-3™ graphics, clock/calendar, printer port, and optional serial port.

Standard with Mega', SixPac' and I/O

is the award winning AST SUPERPAK software. You get SUPERDRIVE™ electronic disk emulation and SUPERSPOOL™ printspooling software.

MegaPlus II™

Includes:

- Clock/calendar with battery back up
- Asynchronous communications port (RS232C serial COM1 or 2)
- Memory sockets for up to 384K
- AST SuperPak Software & Q-Quick Menu

Options:

RAM memory	\$55	GammaPak	\$40
2nd serial port	\$25	MegaPak 124K	\$29
Printer port	\$35	MegaPak 128K	\$19

SixPacPlus™

Includes:

- Clock/calendar with battery back up
- Asynchronous communications port (RS232C serial COM1 or 2)
- Memory sockets for up to 384K
- Parallel Printer Port (LPT1 or 2)
- AST SuperPak Software & Q-Quick Menu

Options:

RAM memory	\$55
Gamma Option	\$35

I/O Plus II™

Includes:

- Clock/calendar with battery back up
- Asynchronous communications port (RS232C serial COM1 or 2)
- AST SuperPak Software & Q-Quick Menu
- One year Parts & Labor warranty

Options:

Gamma Port	\$25
Printer Port	\$25
2nd Async Port	\$55

MonographPlus™

Includes:

- IBM PC compatible Monochrome Card
- 720x340 1-2-3™ compatible graphics
- Clock/calendar with battery back up
- Parallel Printer Port
- AST SuperPak Software & Q-Quick Menu

Options:

Serial port	\$55
-------------	------

Free Monitor Stand with purchase of MegaPlus-256K or SixPacPlus-384K. \$39 value.

The Acid Test

Remember, our price is the whole price. No extra charges for shipping, insurance, credit cards, or COD fees. In a hurry? UPS 2nd day air service is just \$5 extra. If you are not completely satisfied with any Qubie product after 30 days, you can return it for a full

refund. We will even reimburse you for the postage to return it. If you can get any of our competitors to give you the same guarantee, buy any other board you think compares and return the one you don't like. We know which one you'll keep.

The Qubie Plus

Good service starts with answering your questions before you buy. It continues with same or next day shipment of your order. And if your board ever needs service, we perform repairs in our own service department within 48 hours or we replace the board. You also get no cost extras like the Qubie bracket which allows ribbon cables to be mounted without interfering with other expansion slots. Or the Q-Quick Menu™ which provides easy arrangement of Super Drive's and the size of your SuperSpool printer buffer.

YOUR PC CAN BE YOUR NEXT SMART TERMINAL. SmartTerm software can make your personal computer a lot more intelligent than it really is.

Our terminal emulators have the features that do the job: Full keyboard emulation. Multiple setups. TTY mode. "Smart" softkeys. Printer support. Help screens. And a friendly user manual.

Built-in text and binary file transfer is powerful and simple to use, and does not require

any special host software. SmartTerm also features automatic file transfer and two different "error-free" protocols, including XMODEM.

There's a SmartTerm emulator that matches your needs: SmartTerm 100 for emulation of DEC VT100, VT102 and VT52. This program now features 132-column display mode support, using either horizontal scrolling or special 132-column video display boards. SmartTerm 125 includes all the features of SmartTerm 100, plus VT125 ReGIS graphic support. SmartTerm 400 for emulation of Data General Dasher D100, D200 and D400.

More than 10,000 customers have discovered just how smart their PCs can be with SmartTerm. We think you'll agree. Try it for 30 days with full refund privilege.

Call today for more information.

Available through your local software dealer, or Persoft, Inc., 2740 Ski Lane, Madison, WI 53713. Phone (608) 273-6000. TELEX 759491.

IN A WORLD OF CHANGE, THE SMART GET SMARTER™

persoft

start printing page numbers (page two) and hit Enter to print the file.

□ **SELECT Bilingual**

To implement triple spacing, insert a \S3 format code at the top of the document. To define the header line, use a \H Page # format code after the first page has started so that headers will start appearing on page two. Printing the document is accomplished directly from the main menu after saving the file by issuing the P command and then specifying the name of the file to be printed.

□ **Spellbinder**

Printing is done from the Print (F9) option of the Command mode. Before printing, the file is verified; page breaks and words needing hyphenation are displayed. Both verification and printing can be done a page at a time, for all text in memory, or for the entire file if some of it spills over onto disk. Page breaks, title locations, page numbering, and top-bottom and left-right margins are formatted from default values in the Y and YT tables, but defer to Y and YT commands embedded in the file. Verification shows how the document will look when printed. This is the only such view the user gets, since the look of the working file is unrelated to the finished document.

□ **Volkswriter Deluxe**

To print the file, press P at the main menu. At the print menu, press P again for Print Using Current Format. To edit while printing, you must print to disk using the S (Select Printing) device and then W to write a disk file. Then exit the program and print using the DOS PRINT command. Then reenter *Volkswriter Deluxe*.

□ **WordMARC**

Some of *WordMARC*'s print attributes are set on the Edit screen, and some are set from the print options list. On the Edit screen, you can set line spacing and right justification, however, you won't see the results until print time.

Triple space the text by placing the cursor on that part of the ruler bar, hitting the format key, typing a digit from the numer-

ic pad (in this case, indicating six half spaces), and hitting Execute.

Then hit the File key, bringing up the Print menu. Select Options to set the print options. This brings up a complex menu for various printing options. Position the page anywhere in the document and follow it with a number sign. The number sign creates a command "Put the page here." Having set all that up, hit Execute, which takes you back to the Options list, and hit Save, which brings you back to the main menu.

The fourth item on that menu is Print or Review a document. Print will print as formatted. Review will scroll the document as it will appear printed.

To prevent page numbers from appearing on the first page, set up separate formats for the first and following pages.

□ **WordPerfect**

Printing a file can be accomplished in a number of ways. Pressing Ctrl-PrtSc gives you the options to print the full text, print the page, or set print attributes.

Alternatively, you can print a different file or files directly from the disk. Also, each file is given a print job, and you can have the program print one document after another to one of two different printers. Background printing is always enabled, and you can work on your document while printing is in progress.

□ **WordStar**

To print the file from the opening menu, hit P for Print. Alternatively, you could print the file while editing a document by using Ctrl-KP. This lets you print either the file you are working on or any other file.

□ **XyWrite II-plus**

The actual printing of a file requires the entry of the TYPE command on the command line, along with the filename. If you want, you can add n-n to limit the pages that are printed. You can also add a P to make the printer stop and wait after each page is finished. If you want to preview the output in exactly the form it will be printed, with footnotes, headers, and footers in place, just hit Shift-F10 while the

file is on the screen and tell the program whether you want the output file to be shown on a split or alternate screen.

The program creates a formatted file that can be edited further if needed. Care must be taken with the formatting at this point, since the output file has hard carriage returns at the end of each line. In fact, when you give the TYPE command, a temporary Print file is created in the same way, which means that your original text file is left completely intact for further editing at your convenience.

ERROR HANDLING

(continued from page 142)

□ **ReadiWriter**

Error handling in *ReadiWriter*'s *ReadiEdit* program is adequate. In the main *ReadiWriter* program it is excellent. In most cases, you'll get a long English-language explanation of just what went wrong and a choice of several ways to proceed. Debugging your formatting codes is therefore simply a matter of listening for beeps and reading the screen.

□ **Samna Word III**

If you open the drive door, you get the following message: "Drive B is not ready. Insert disk and touch any key to continue or cancel." Close the disk drive door, hit any key, and you can continue.

If you remove the program disk while you are editing, you will get the following message: "Drive A is not ready. Insert disk and touch any key to continue or cancel." As soon as you put the program disk back in, you can resume editing.

Data disks are trickier. Since *Samna Word III* is constantly writing to disk, if you are working on a file and take that disk out, the program gets confused and dumps you out to DOS.

□ **SELECT Bilingual**

Entering an invalid menu selection elicits a beep. In more complicated situations, short error messages appear and, at least in one instance, erase themselves after a few seconds. *SELECT* can recover from "out of space" errors, but not other common errors such as leaving the drive door open.

BANK STREET WRITER

Bank Street Writer provides an unusual help screen when you press Alt-K: an on-screen graphic depiction of the most frequently used keys

SPELLBINDER

The editing screen for SPELLBINDER. The status of the function keys at the bottom of the screen changes with the Edit and Command modes.

In the latter case, if you respond A to the DOS "Abort, Retry, Ignore?" message you will lose whatever file you were working on.

Spellbinder

Error handling in *Spellbinder* could be bet-

ter. Messages are cryptic, mistyped commands often are erased from the command line before you can see what they are, and inadvertent disk swapping can garble the document or even the whole disk. Running out of disk space isn't a fatal error, but you may lose one or two lines.

Volkswriter Deluxe

When you enter an illogical command, the program beeps and prints "Beg your pardon?" The error message is self-explanatory. In response to an I/O error, it beeps and displays "Drive B: not ready. Is door open/power off?—retry (Y/N)" Type Y and *Volkswriter* will resume.

WordMARC

Erroneous subcommands are left on-screen so you can correct them. If you make an I/O error, *WordMARC* responds: "Drive not ready (Abort, Retry, Ignore)."

WordPerfect

WordPerfect's error handling is quite good. Before you leave the word processor, you are asked if you want to save the document, and the program produces Y/N prompts in most areas where you are likely to do something you will later wish you hadn't.

WordStar

An illogical command generates a self-explanatory error message. To recover from an I/O error (Abort, Retry, Ignore), you can close the door and choose Retry. If you choose Abort, you will be dumped into the system and probably lose your file.

XyWrite II-plus

When you make a subcommand error, you get a beep and a self-explanatory message. If you make an I/O error, *XyWrite II* produces a "Disk error" message; then if you hit the key F5 to clear the command line, the program replies: "FILE exists—overwrite? Y/N." If you reply with N, it goes back to the normal state and you can clear the line and continue.

EXITING THE PROGRAM

(continued from page 146)

Volkswriter Deluxe

At the main menu, type X for Exit. If you did not save the file, a prompt will ask whether you really want to exit. At this point, you can re-enter the *Volkswriter* program or exit to DOS.

THEY TALK

TO EACH OTHER.

THE PORTABLE.

The best portable business computers never stand alone. That's why The Portable from Hewlett-Packard is completely connectable to the IBM® PC, XT and the Hewlett-Packard Touchscreen PC. Simply add The Portable-Desktop Link and you can exchange files with surprising ease.

The Portable lets you take serious business computing power anywhere...656K of memory (including 272K of user memory) and a full 16-bit processor. That's enough power to get maximum use of 1-2-3™ from Lotus™ and MemoMaker,

Hewlett-Packard's word processing program. Both are permanently built in. The Portable even features a built-in modem and easy-to-use telecommunications software. The Portable can operate on AC or battery power and it weighs only nine pounds. The Portable...a remarkable machine. But then consider where it came from.

See The Portable and the entire family of personal computers, software and peripherals at your authorized Hewlett-Packard dealer. Call (800) FOR-HPPC for the dealer nearest you.

Setting You Free

The automatic transmission with a \$250 differential.

What a way to travel! The Password™ modem is geared to transmit up to 120 characters a second from anywhere to anywhere else in the country at the push of a button. Adjusts automatically to any speed — moving at a high of 1200 baud, or down-shifting all the way to 300 baud.

Totally compatible, it lets any microcomputer phone-communicate with any other microcomputer. Easily portable, it parks almost anywhere thanks to the convenience of Velcro™ strips.

The Password modem turns out text ten times faster than an expert typist — sends thousands of words by phone for less than express mail. And our automatic transmission

comes through in the clutch by automatically dialing or answering your calls. Now look at the sticker price! At \$449, we're about \$250 less than the best-known modem. A very sizeable difference. Especially considering that both send and receive at the same speeds, and both carry a two-year limited warranty.

The Password modem. High performance at a compact price.

☐ WordMARC

Whenever you have an existing screen up, if you want to get out, you must hit the appropriate function key. It brings up a menu that has these options: Option (for printing); Refile this document as changed; No save this editing session; Save and name this document; Save this *WordMARC* document in an ASCII format; WM (save this document in a *WordMARC* format); and Return to editing session.

Assuming we're working on an old document, use the Refile option. If it's a new document, use the Save and name option. It asks you to type the document name and hit the key assigned to the Execute function. It then goes back to the original main menu. Select the EXIT command.

☐ **WordPerfect**

Press Alt-O and you get a prompt "Save document y/n?" If you say no, you find yourself in DOS. If you say yes, you are presented with the original name, and you can save the document under that or any other name you wish to give it.

☐ **WordStar**

To exit from *WordStar*, you can either hit Ctrl-KX from the file, which will automatically save that file, or X from the main menu. Hitting Ctrl-KQ will quit the file without saving it and return you to the main menu; if you have made changes in the file, *WordStar* will ask you to confirm the exit.

☐ **XyWrite II-plus**

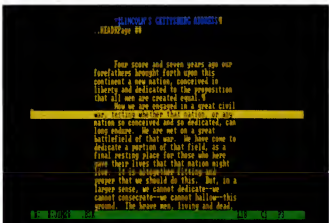

To exit the program, you give the QUIT command from the command line. If you have any files open at the time, the program will ask if you want to quit anyway as a reminder that you have not saved the active file.

BELLS AND WHISTLES

(continued from page 148)

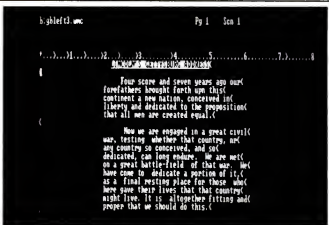

and Replace function, and its automatic save.

Overall, *Leading Edge* is a flawed package, but impressive for the price. If

you're in the market for an inexpensive word processor, it's certainly worth a look.

☐ Microsoft Word

Microsoft Word incorporates the award-winning system used in Microsoft's Mul-

tiplan. *Multiplan* users will pick it up in minutes. For \$100 extra, *Word* comes bundled with its own mouse.

Word is a well-thought-out, finely executed product, and it should prove to be highly competitive in the world of advanced word processing.

WORDPERFECT

LINCOLN'S GETTING ANGRY

Four score and seven years ago our forefathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived, and so dedicated, can long endure. We are met on a great battle-field of that war, we have come to dedicate a portion of it, as a final resting place for those who here gave their lives that their nation might live. It is altogether fitting and proper that we should do this.

But in a larger sense we can not dedicate—we can not consecrate—we can not hallow this ground. The brave men, living and dead, who struggled here, have consecrated it far above our poor power to add or detract. The world will little note, nor long remember, what we say here, but it can never forget what they did here. It is for us, the living, rather to be dedicated here to the unfinished work which they have, thus far, so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they here gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain; that this nation, God bless it, by the sword of liberty shall stand.

Doc E. Py L. Lu 16 Nov 40

The editing screen for WordPerfect. The program uses the function keys and the top row of number keys for processing commands.

MultiMate

MultiMate is the PC adaptation of the dedicated Wang Word Processor. Part of the Wang method was to take what we already did as writers and use the new computer technology to create something simpler, more comfortable, and more accommodating. MultiMate's design so closely follows what you do when you use a pencil or a typewriter that a moderately experienced word processing user can boot MultiMate up and begin to work right away using the comprehensive, well-written help menu.

Nothing is perfect, however. Some of MultiMate's characteristics irritate me. For instance, if you keep your finger on the cursor keys to scroll up or down a page, you can be suddenly launched to the next page when the cursor reaches the end of the copy. This feature is a pain and of little value, I think; I'd rather use the Ctrl and PgDn or PgUp keys to get to a different page.

In its latest incarnation, MultiMate is considerably slower than it used to be. Although I appreciate the added safety, I must say that I have had to find a completely new rhythm to my writing.

But those are petty objections to a program that is an undeniable industry standard for products of its type—dedicated

word processors that support the process of writing.

Will Jones and his colleagues can indeed take credit for having the wisdom to let Dr. Wang's insight into the writing process stand.

Palantir

Palantir is a powerful new product with a hopeful future. Its designers intend to conduct a "features war" in the months to come, to see whose package can do more things. You can expect to see automatic indexing and table of contents features in future releases. In my opinion, when a word processing program gets top-heavy it's time to divide it like an amoeba into text-editing and text-formatting phases. Palantir's designers will have their hands full trying to support serious word crunching functions in an interactive setting.

PC-Write

PC-Write does lots for its price—you can get it free or for as little as \$10. Registering with Quicksort is a good idea, however. Registration costs \$75 and gives you the benefits of new updates as they occur, telephone hotline, and a printed copy of the manual—it's an unusual and interesting marketing concept.

PC-Write is very fast—moving copy from page to page is astonishingly fast because the program holds most of your file in a buffer.

PC-Write makes extensive use of DOS. It does not bypass DOS for file directories on your data disks, for example. It uses DOS commands such as COPY, RENAME, DISKCOPY, and FORMAT as an integral part of its program. You will find yourself moving back and forth into DOS more than with most other word processors.

I do not believe a word processing veteran would be able to learn PC-Write without using the manual. Command-driven word processing veterans would stand a bit of a chance, but in my opinion, even with the manual, the task of learning PC-Write is more challenging than that of many other word processing programs.

However, the program as a whole grows on you, and it is fun to use, especially in entering and editing text.

Perfect Writer

Perfect Writer has a number of annoying defects. It makes poor use of the function keys, often assigning them trivial or peculiar commands instead of complex executions that are tedious to do with the menus. It desperately needs column, line, and page-location information on the status line. The program lacks automatic text realignment and will reformat only one paragraph at a time, returning the cursor maddeningly to the top of the paragraph. Its print program has trouble handling parentheses. And, although experienced users can bypass the menu displays by typing the initial letters of each menu choice from memory, many will find the system exhausting.

But for users who want extraordinary power and maximum ease of learning at a reasonable price, Perfect Writer is hard to beat.

PFS:WRITE

If reliable, easily learned, no-frills word processing is what you need, PFS:WRITE may be the program to own. Most PC owners, if handed the PFS:WRITE disk and the card explaining the function keys,

Why people choose an IBM PC in the first place is why people want IBM service...in the first place.

After all, who knows your IBM Personal Computer better than IBM?

That's why we offer an IBM maintenance agreement for every member of the Personal Computer family. It's just another example of blue chip service from IBM.

An IBM maintenance agreement for your PC components comes with the choice of service plan that's best for you—at the price that's best for you.

Many customers enjoy the convenience and low cost of our carry-in service. That's where we exchange a PC display, for example, at any of our Service/Exchange Centers.

And for those customers who prefer it, we offer IBM on-site service, where a service representative comes when you call.

No matter which you choose for your PC, an IBM maintenance agreement offers you fast, effective service.

Quality. Speed. Commitment. That's why an IBM maintenance agreement means blue chip service. To find out more about the specific service offerings available for your PC, call 1 800 IBM-2468, Ext. 141 and ask for PC Maintenance.

Blue chip service from **IBM**

CIRCLE 162 ON READER SERVICE CARD

A picture is worth a thousand words. **In color, maybe two thousand**

...with ABM's \$95 Col-Mon™

The Col-Mon™ (Color to Monochrome Adapter) is an interface module that plugs into the RGB output of the color card. It converts the signals from the IBM or compatible color board so graphics and text can be displayed on the IBM monochrome monitor.

Compared to the \$499 Hercules Card, the \$95* Col-Mon:™

- Runs all IBM Color/Graphics compatible software, not just a few programs.
- Can be configured so both a color and monochrome display work simultaneously.
- Doesn't use an expansion slot.

GraphMagic & ColorMagic are trademarks of Brightbill-Roberts & Co. Ltd. Lotus 1-2-3 is a trademark of Lotus Development Corp. Hercules is a trademark of Hercules Computer Tech. IBM is a Registered Trademark of I.B.M.

*Plus local dealer installation charges where applicable

...with ABM's ColorWizard™

The ColorWizard™ gives you both hardware and software to help you create professional business graphics, organizational charts and illustrations. Use GraphMagic™ to create them, then edit your graphs with ColorMagic™ to add stunning slideshow presentation quality.

- **ABM Colorboard™**—Totally IBM color/graphics adapter compatible board, that also provides output for shades of grey on composite monochrome monitors.
- **GraphMagic™**—Analysis Graphics that works with files from all popular spreadsheets such as Lotus 1-2-3™ and quickly creates business graphs (bar, line, pie or all three simultaneously) for output to any printer or plotter.
- **ColorMagic™**—A presentation graphics processor that lets you create and edit graphs like a word processor handles text.

Personality For Your PC

**ABM COMPUTER
SYSTEMS**

3 Whatney, Irvine, California 92714
(714) 859-6531 TELEX 292427 ABM UR

could successfully compose, edit, and print letters and reports without ever cracking open the user's manual. It's that simple.

The main reason for this simplicity is the program's lack of bells and whistles. *PFS:WRITE* underlines, boldfaces (doublestrokes), automatically wraps too-long words down to the next line, moves blocks of text around, and searches and replaces. That's about it.

PFS:WRITE is an excellent choice if you can live with the limitations of 15-page documents and one-width margins of no more than 78 spaces. Buy this one for occasional typing functions. Look elsewhere to supply the word processing pool or write *The Great American Novel*.

☐ **ReadiWriter**

ReadiWriter is basically a text formatter and should be used with the text editor of your choice. It may seem like you're getting only half a product, but it's actually not very different from buying separate components for your stereo system. Superior text formatting is the goal of this program, and it achieves this goal splendidly. With powerful built-in capabilities for formatting footnotes, tables of contents, and indexes, *ReadiWriter* is ideal for knowledgeable users with professional word processing needs.

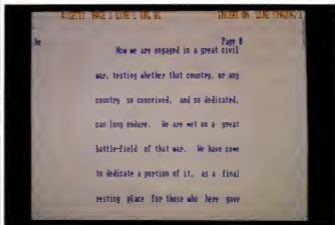

☐ **Samma Word III**

This program is loaded with features, is a breeze to learn, and gets good telephone support from its vendor. However, it fails in one vital area: text editing. First of all, editing is too slow. The cursor lumbers across the screen rather than snapping into position.

Another bother is automatic paragraph reformatting. After you insert or delete anything, you have to wait while the paragraph gets reformatted before you can do anything else—and reformatting takes about half a second per line. This is especially annoying if you want to delete a word or a phrase and replace it quickly with another.

The move-by-word and move-by-sentence cursor commands also have an irksome side effect. If you are creating text

WORDSTAR

The editing screen for *WordStar*. If needed, a help menu can be called by changing the program's help level.

and have backed up to make a correction, you'd naturally like to shoot the cursor to the end of the text so you can go on writing. Crazy enough, if you move by word or by sentence, the cursor will not stop at the end of the text, but will bounce past the end of the last line and end up in the first column of the (blank) line below. You have to fiddle with the arrow keys to get back into a position where you can start creating more text. The move-by-file command will put the cursor at the end of the last line, but it bumps the whole text up into the top quarter of the screen so you can't see much of what you've already written.

People use word processors for different purposes and have different ideas about what makes a good one. But it's a shame to see so many excellent word processing features hung onto a text editor that's just not up to snuff.

☐ **SELECT Bilingual**

SELECT Bilingual is probably an excellent package for those new computer users who simply don't have the time or patience to learn very much about computers. It provides most of the word processing features ordinarily required in the business world and has an excellent and enjoy-

able tutorial program.

☐ **Spellbinder**

Spellbinder has a lot of rough edges along with many nice features. It desperately needs a manual that doesn't treat the PC and its function keys as an afterthought. A more transparent method of dealing with files and an on-disk tutorial would make *Spellbinder* much more attractive. But if you've got the time to sit down and really read the manual, and if polished, finished copy is what you want, *Spellbinder* could be a good choice.

☐ **Volkswriter Deluxe**

I was one of the first users of the original *Volkswriter*, and I've been writing with it, in its successive upgrades, for almost 2 years. Its latest incarnation, *Volkswriter Deluxe*, is my favorite word processing program for the IBM PC.

Sure, I know there are programs with more features. Some let you edit several documents at once, or manage your footnotes, or even remind you to call your mother on her birthday. But for the basics—speed, reliability, and ease of use—it's hard to beat *Volkswriter Deluxe*.

This isn't to say that *Volkswriter*

XYWRITE II-PLUS

The editing screen for *XyWrite II-plus*. The help screens can be accessed by hitting Alt-F9 and can be altered to suit the user's needs.

Deluxe is perfect. If pressed, I could pick a few nits. For example, I don't like the way it highlights the last line of each page in reverse video (on a monochrome display driven by a color/graphics adapter). I find that the glare of that line is hard on my eyes; I prefer the more subtle line of dashes *WordStar* uses to mark the end of a page. And I wish the program could calculate the right page breaks in a document containing both double- and single-spaced lines. You can specify this kind of mixed spacing, but the editor will display page breaks as if the entire document were single- or double-spaced. To see where the page breaks will really fall, you have to preview the output on your screen using the print menu.

A few advanced features would enhance this superior package. It would be nice to have windows and footnote management, for instance. But these are features I can do without, and because of its speed, reliability, and ease of use, *Volks-writer Deluxe* will probably remain my favorite for a long time to come.

☐ **WordMARC**

WordMARC is top-heavy with features such as encryption and multilingual prompts, but the package is light on

sophisticated, document-related features such as screen formatting. *WordMARC* was obviously designed for a Fortune 500-type company that has dozens of workstations using various types of hardware. The makers really went for compatibility among CP/M and DOS systems at the cost of what seems to be the nice touches that can be found in many similar word processing systems. Whoever buys *WordMARC* is paying for a lot of compatibility-related features at the cost of important word processing features.

☐ **WordPerfect**

All in all, *WordPerfect* is absolutely stunning. I have had the opportunity to try out numerous word processing packages, and this is the one I have chosen for myself. It offers features such as horizontal scrolling, report generation, calculations, and a very powerful macro system. I am told that this fall we can expect new *WordPerfect* features such as table of contents and index generation, as well as a revamped spelling system.

☐ **WordStar**

WordStar has been around for so long, and in such a position of prominence, that nearly anyone who has even investigated

word processing has at least a passing acquaintance with the program. Unfortunately, a "passing acquaintance" often translates as an "inadequate introduction," and there is a great deal of misinformation about *WordStar* that masquerades as common knowledge. Everyone "knows" that *WordStar* is difficult to learn, difficult to use, filled with arbitrary commands, and—the death blow—that it is an obsolete word processor that has fallen far behind the state of the art. According to one line of thought, the program survives only because *WordStar* users have been so traumatized in learning it that they refuse to try anything else. In short, it's a program that people love to hate. If the program were a person, it would be the machine politician who keeps getting re-elected only because the opposition can't mount an effective campaign.

I beg to differ. I have been using *WordStar* for 3 years, and I have to admit that I like this much maligned program—and have from the beginning. Contrary to its reputation, I have found it easy to learn and easy to use. Granted, it lacks one or two nice features found in many similar word processing packages, but it still stands up point-for-point against such "advanced" programs as *Perfect Writer*, and *FinalWord*.

Ultimately, your choice of a word processor will depend on your own biases and on the type of writing you do. For me, though, *WordStar* passes the most important test: It stays out of my way and lets me get on with the job of writing.

☐ **XyWrite II-plus**

XyWrite II-plus is one of those rare programs that is so good that you almost have to go out and buy somebody else's program along with *XyWrite* in order to fully appreciate what you have. You have at your fingertips all of the functions that you would normally expect, plus features you would not have thought of but now discover you cannot do without. An earlier release of the program was recently reviewed in *PC* ("XyWrite Way to Go," Volume 3 Number 11). Since the time of that review the program has been expanded and improved even more. ■

THE JUKI 6100 DAISYWHEEL PRINTER: ONE STRONG FEATURE AFTER ANOTHER.

Because a printer is only as strong as its features—only the JUKI 6100 gives you *all* these strong features: • compatible with most personal computers (IBM, Apple, Kaypro, etc.) • lightweight • quiet • prints graphics • bidirectional • 2K buffer memory (expandable to 8K) • bidirectional tractor feed option • proportional spacing • 100-character drop-in daisywheel • uses inexpensive, easy-to-find IBM Selectric II® ribbon • **ALL FOR UNDER \$600!**

JUKI 6100: feature for feature, it's the best all-round printer anywhere. Could it be the "missing link" your personal computer system needs? Ask to see the JUKI 6100 at your local JUKI dealer.

THE RACE FOR SPACE

Maynard's in the lead with an expanding universe of space-saving systems for your PC!

Modular disk drive systems by Maynard Electronics drive technology to the limit to deliver unmatched performance with PC-DOS compatibility including self-booting off the hard disk.

10MB Winchester Internal Hard Disk Drive System!

This dynamic system lets you upgrade your PC or compatible to XT effectiveness, is internally installed, and does not require an additional power supply! The 10MB Hard Disk Drive System is equipped with the SandStar™ Hard Disk Controller Card which can accept up to three additional modular functions. Or, configure your system with the Hard Disk Controller Module and the SandStar Floppy Drive Controller Card which runs 5 1/4" and 8" Floppy Drives while still leaving four expansion slots for additional boards! Or, if you prefer, arrange your system with the Hard Disk Controller Module and the SandStar™ Memory Card which lets you add from 64K to 576K of memory using only one card slot!

Maynard's SandStar™ Cards and Modules can put you lightyears ahead...

With technology racing into the future, serious computer users need to set their sights beyond obsolescence. Through the use of versatile SandStar™ Cards and Modules, Maynard has been able to engineer hardware to keep pace with tomorrow's needs. With Maynard's Disk Drive Systems and SandStar™ Cards and Modules, you won't be left behind in the race for space. For more details, call your dealer or distributor today.

NEW! "The Apollo" 30MB Internal Hard Disk Drive.

This powerhouse comes with 30MB of on-line storage using PC DOS without any special software drivers. Discover new worlds of data efficiency and versatility. Our 30MB system includes the Hard Disk Controller Card or any of the other SandStar™ Cards with Hard Disk Controller Module.

NEW! "The Gemini" Hard and Floppy Drive System.

Now, for the first time, add the Gemini to your one drive system and take full advantage of internal Hard Disk power along with two internal Floppy Drive units. The Gemini comes with a sleek 10MB Half-Height Hard Disk Drive, a Half-Height Floppy Disk Drive (5 1/4"/5 1/8"), and the

SandStar™ Floppy Drive Controller Card with the Hard Disk Controller Module. Boost memory capacity dramatically while using no more space than a standard floppy drive! The Gemini can also be configured with either the SandStar™ Hard Disk Controller Card or the SandStar™ Memory Card with the Hard Disk Controller Module.

"If you make more than \$35,000 a year. . .

Lumen has designed personal financial planning and management software for you. It can help you gain control over what may have been hit-or-miss financial planning. These days you can't afford hit-or-miss."

—W. Thomas Porter

Director of Personal Financial Planning Services for the
Big-8 Accounting firm of Touche Ross

"When I wrote a best-selling book on personal financial planning and management, I wanted to provide a complete structure men and women like you could use to gain total control over their own financial affairs. Now Lumen has transformed the financial planning and management methods revealed in my book into two easy-to-run software packages for the IBM-PC *."

The Personal Financial Planner

- 1. Net Worth Statement:** Calculated for you instantly.
- 2. Income and Expenditure Ratios:** Are you within safe limits? Your Planner will tell you.
- 3. Investment Analysis and Strategies:** Based on your own financial circumstances.
- 4. Tax Planning:** The Planner helps you maximize benefits and minimize tax exposure.
- 5. Retirement Planning:** Find out what you should be doing now to make your retirement dreams come true.
- 6. Estate Planning:** The most important facet of personal financial planning becomes a breeze.
- 7. Education Financing:** You have four children, ages 6, 9, 12, and 15. How much should you be setting aside now for their education?
- 8. Insurance Analysis:** Are you overinsured? Underinsured? Do you have the right kind of coverage? The Planner will tell you.
- 9. Personal Data:** Up-to-the minute personal financial data at the push of a button.

The Personal Financial Manager

- 1. Checking Accounting Management:** Provides instant checkbook balancing — absolutely accurate.
- 2. Credit Card Accounts:** No more racking your brains when an incorrect bill comes in.
- 3. Assets / Liabilities:** You'll know instantly what you owe and what you own. Changes take only a few seconds.
- 4. Budget Tracking:** Are you on budget? Over budget? Under budget? Find out what you need to do to stay on target.
- 5. Check Printing:** The Manager can actually write your checks for you. And your balance adjusts automatically.
- 6. Double Entry Bookkeeping:** The Manager sets up double entry books for you automatically.
- 7. Account Status:** You get a complete series of 170 pre-defined accounts. No time wasted setting up your own.
- 8. Tax Reports and Codes:** All your tax records kept in perfect order. You can do your income taxes during halftime of the Rose Bowl.
- 9. Transaction Maintenance:** Income from all sources and expenses to all sources are orderly and balanced. Pull a report whenever you want or need one.

Command

Performance! You bought your IBM PC® with the full intention of making it perform. But, computers are an exception to the old rule, practice makes perfect. It takes real skills just to get started.

It doesn't matter if you're a beginner or an advanced user. If you wish to master the keyboard—for your pleasure or your profession—The Brady Co. publishes the books you need to become a virtuoso.

At the keyboard, you need to know much more than just the score—there's BASIC to be mastered, com-

puter fundamentals, programming skills, software, graphics, sound, word processing, educational functions, and much, much more.

To help, The Brady Co., a Division of Prentice-Hall, has assembled the authors who are the experts in the field of personal computing. These authors have written about the IBM PC in simple English at a level to appeal to your experience. With easy to follow instructions, sample programs, and plenty of examples, Brady Books will help you give a command performance on your IBM PC!

Performance

IBM PC & XT OWNER'S MANUAL: A PRACTICAL GUIDE TO OPERATIONS

Barbara Lee Chertok, Dov Rosenfeld and James Stone

This entry level book provides easy instructions on the operations of the IBM PC. After reading this new guide with clear, concise examples, the PC user is up and running on the machine in a minimum amount of time — without programming classes. 1984/200pp/ISBN 0-89303-531-9/\$14.95

IBM PC: AN INTRODUCTION TO THE OPERATING SYSTEM, BASIC PROGRAMMING AND APPLICATIONS, REVISED AND ENLARGED

By Larry Joel Goldstein and Martin Goldstein

An updated and expanded version of what has become the classic self-study book for the IBM PC, this book is a must for your computer library. New chapters on BASIC emphasize the importance of structuring and planning programs and important new information on debugging. Games and graphics are included and the section on random access has been expanded. It includes DOS 2.0.

An Attaché from Down Under

Attaché Software enjoyed tremendous success in Australia with its line of accounting software. Now the company has moved its headquarters to the United States and is courting major U.S. accounting firms in an attempt to garner a slice of the accounting software pie.

At the Winter COMDEX show last February, the PC software industry welcomed a new U.S. company and a new line of accounting software into the mix. Attaché Software, Inc., introduced *Business Pack I* and *Business Pack II*, a series of five accounting modules that are aimed at the general accounting needs of small businesses.

The name "Attaché" comes from the distinctive packaging of the products. The software comes in two simulated leather attaché cases, complete with combination locks. One case contains *Business Pack I*, which includes the *Accounts Receivable*, *Invoicing/Sales Analysis*, and *Inventory Modules*. The second case contains *Business Pack II*, which includes the *General Ledger* and *Accounts Payable* modules. To get the software out of the cases, you call a toll-free number and someone at the other end tells you the combination for the locks. It's not clear why Attaché grouped the packages as it has. Each module can operate independently and can be purchased separately, although you receive a discount when purchasing them in a *Business Pack*. Unfortunately, the *Business*

Pack I modules don't contain automated interfaces to the *General Ledger*; only the *Accounts Payable* system can be so integrated. However, Attaché expects to issue an update this summer that will allow all the modules to be integrated with the *General Ledger*.

Up from Down Under

If this family of accounting packages is foreign to you, you're not alone. Until recently, Attaché was virtually unknown in the United States. The software was developed in Sydney, Australia, several years ago and debuted in the United States at COMDEX in Los Angeles last February. At about the same time, Attaché moved its corporate headquarters to Ann Arbor, Michigan, and from this new vantage point the company is formulating plans to attack the American market.

Attaché's approach couples an easy-to-use product line with a uniquely aggressive marketing plan. While marketing the software in Australia, the company concluded that a comprehensive accounting system (even a micro-based one) requires accounting and financial expertise for proper installation and implementation. Attaché therefore aligned itself with a consortium of Australian accounting/consulting firms to assist customers with the implementation of the packages. From a marketing standpoint, the arrangement worked well; Attaché's software went on to become one of the most widely installed micro-based accounting systems in Australia. To top it off, IBM took note and agreed to market the Attaché packages through its Australian retail outlets.

Hoping to follow this success with a coup in the United States, Attaché has already secured marketing agreements with several major hardware manufacturers. The product will begin to appear on retail shelves this summer. The company also has a far-reaching plan to introduce its product to the major accounting/consulting firms in the United States. It intends to set up regional training centers for the consultants—a convenience for the account-

ing firms and for Attaché itself, since this will likely reduce the company's direct support requirements. There is also a promise of hot-line technical support for the consulting and dealer communities. Further, Attaché is planning an extensive program with community colleges and is hoping to encourage the hardware manufacturers to contribute equipment to the colleges.

Marketing strategies aside, here's a look at the packages themselves.

General Ledger

We'll first examine the core of Attaché's packages, the *General Ledger* and *Accounts Payable* modules, which comprise *Business Pack II*.

The *General Ledger* handles the conventional financial recordkeeping function, allowing you to create and maintain a general ledger, customize your chart of accounts, enter accounting transactions, and produce the necessary audit trail listings and financial reports. When setting up your system, you must decide how you want to structure your chart of accounts, whether to use 12 or 13 periods, and so forth.

Figure 1 illustrates the screen on which you specify the parameters of the general ledger. Note that, while the account code allows for only eight alphanumeric characters, it may be formatted into three segments—division, account, and subaccount—in any combination. With a structure like this, the general ledger package could even be used independently as a job-costing system. Although the system is capable of handling only a single company, multiple ledgers can be maintained on separate data diskettes or hard disk volumes. The system allows for seven different reporting periods ranging from one annual to thirteen 4-week periods.

With the Management Accounting function (part of the *General Ledger* module), budget data can be entered for selected accounts through the use of one of eight methods. This is one of the most flexible budget-development capabilities that

List Prices: *Business Pack I*; \$1,425 (consists of *Accounts Receivable*, *Invoicing/Sales Analysis*, and *Inventory Control* modules).

Business Pack II; \$1,095 (consists of *Accounts Payable* and *General Ledger* modules).

If purchased separately, modules cost \$595 each.

Requires: 128K RAM, two disk drives or a hard disk, MS-DOS 2.0 or later, 132-column printer or an 80-column printer with compressed print.

CIRCLE 769 ON READER SERVICE CARD

A ttaché's software was developed in Australia several years ago and debuted at COMDEX in Los Angeles last February.

we've seen in a PC-based package. While the versatility of the budgeting features is not matched by the other features of the system, the budget input options are worth mentioning. The following options are available:

- An annual amount is entered and then automatically divided equally among the periods;
- A first-period amount is entered and then automatically repeated for the other periods;
- A first-period amount is entered and subsequent periods are escalated by a percentage or amount for each period;
- First- and last-period amounts are entered, and amounts for intervening periods are automatically interpolated;
- Each period is entered explicitly;
- A given amount is applied to a range of periods;
- An annual amount is entered and a specified percentage of that amount is applied to each period; or
- An across-the-board percentage increase over the previous year is divided equally over the periods.

Account creation and rudimentary report formatting can be handled with a single input screen for each account. A sample of the resulting master file of data associated with an account is illustrated in Figure 2, using a hypothetical company called 19H Enterprises. Because this file serves

both as a Chart of Accounts and a Report Format file, report-formatting features such as subheadings and underlining must be given account numbers. This is a bit clumsy, but Attaché tells us that the problem will be taken care of in a forthcoming update.

The report type indicates whether the account shows up on the balance sheet or income statement, which are the only financial reports generated by the Attaché system. An account type (selected from among eight options) must be stipulated to control how an account item will show up in the reports. This designation also assists in transaction processing by preventing accidental entries to inappropriate accounts. For example, when processing cash disbursement transactions, the program will request a Type 3 account (bank account) for posting cash debits or credits for double-entry accounting purposes. You can also specify whether each account balance is usually a debit or credit amount, which helps when processing journal entries.

The Add-to Accounts field performs the task of accumulating account balances that will show up as part of a subtotal row on the reports. In Figure 2, for example, balances in accounts 1.1481 and 1.1482 will "add-to" each other to come up to the subtotal in account 1.1490 (Total Other Assets). Percentage codes allow any line

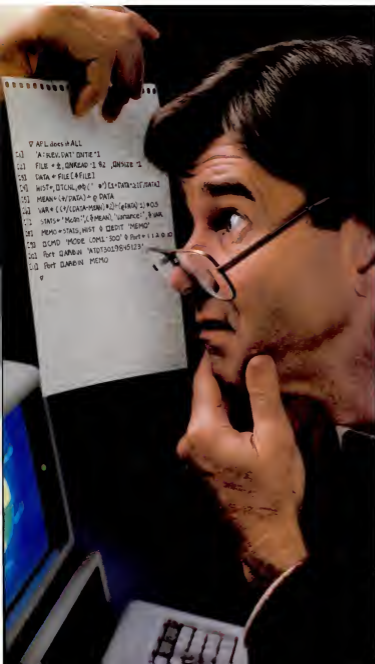

item to be reported as a percentage of some base amount (sales or total stockholders' equity, for example).

The Paired Account field permits similar accounts to be netted against each other so that only the net balance will be presented in the reports. In Figure 2, account 1.1130 (Cash in bank) is paired with account 1.2030 (Bank overdraft); as a result, the balance sheet report will present the net cash position.

The transaction processing (journal entry) function bears mentioning for several reasons. Transactions are processed in batches; each batch contains transactions of only one type (that is, cash disbursements, cash receipts, and the like). Control totals can be entered to help you ensure the accuracy of the data that has been entered. Incidentally, batch report printing can be deferred, but eventually an audit trail must be produced before closing can occur. The number and value of deleted transactions is retained and noted on a batch summary report.

As transactions are input, they are immediately posted to both a Transaction Master file and the current Management Accounting file. The Management Accounting file contains both current period and year-to-date budget information, as well as current period transactions. This can provide you with an up-to-the-minute trial balance and allows you to edit

Tell this to your PC and see what happens.

No, it won't roll over and play dead. While the funny-looking symbols might not make immediate sense to you, to a PC equipped with STSC's APL•PLUS®/PC System they tell an amazing story. In just 11 lines this program describes a sequence of events that can't be accomplished by any other single software package.

The program is written in an application development language called the APL•PLUS/PC System. Briefly, here's what it does. First, it sorts a DOS file containing revenue data and plots the revenues as a histogram. It calculates mean and variance revenues. Then with the help of a full-screen editor, it creates a memo combining the histogram, statistics and descriptive text. Finally the program issues a DOS command to the PC, dials a host computer, and electronically mails the memo. All in just 11 lines. No wonder a *PC Magazine* reviewer reacted to our APL•PLUS/PC System with "awe and delight" (March 1983).

If you want to integrate existing software or create custom solutions to problems that can't be handled by the software you're currently using, you need the APL•PLUS/PC System. It costs \$595.00, and runs on the IBM PC with 192 KB of RAM as well as on a number of compatible machines.

To order the APL•PLUS/PC System or to receive your free convincer kit, write or call STSC, Inc., 2115 East Jefferson Street, Rockville, Maryland 20852. (301) 984-5123.

PRETTY KITTY

The most beautiful color printing in captivity.

We're Dataproducts, the largest independent printer manufacturer in the business. We supply printers to the top computer companies in the world.

When our Paper Tiger® first displayed the color of its stripes, everyone liked what they saw. And no wonder. As a color computer printer, Paper Tiger is a beauty of a beast.

Paper Tiger's high performance color ribbon delivers any color you desire. It will even print alternate lines of copy in different colors. Facts really stand out and points are more easily understood when graphs and charts are printed in Paper Tiger's deep, rich colors.

Paper Tiger puts real teeth in its black and

white printing too. It prints clear and crisp and fills a full page in any of three print speed modes: high speed data processing quality, correspondence quality and is a star performer at letter quality speed. It uses plain and pin feed paper and has an automatic sheet feeder for very fast and easy paper handling. Paper Tiger plugs in easily to perform with all popular personal computer hardware and software, like Lotus® Volkswriter Deluxe, Apple® and IBM®. It even prints on transparencies for overhead projections.

When you're looking for a computer printer that does brilliant things with color, remember our pretty kitty, Paper Tiger.

For more information, go to your nearest computer store, or call Dataproducts at 800-258-1386.

Dataproducts Paper Tiger. The most powerful name in computer printers.

Nobody puts ideas on paper so many ways: Dataproducts Corporation, Route 13 South, Milford, NH 03055.

transactions at any time during the year. Because the current Management Accounting files must be closed at the end of each period (historical files are not maintained), you must create archive files so that detail is not lost. This could be cumbersome if prior period adjustments must be posted to a number of archived files in order to produce revised management accounting reports. We're told that Attaché will be improving this feature in an enhancement to the *General Ledger* program that's expected this fall.

Accounts Payable

The Attaché *Accounts Payable* system provides you with the ability to maintain vendor information, enter invoices, print checks, and control cash flow—just what an accounts payable system should do. The system recognizes a single financial account to be stipulated for your bank account, against which all payments will be credited via the interface to the *General Ledger* program.

Each vendor must be assigned an alphanumeric ID of up to six characters as a primary key. An alternate key (up to four alphanumeric characters) can permit sorting by last name, area code, suburb, or any other field. Vendor inquiry is simplified by the use of a special "generic" inquiry facility on either the vendor number or the alternate key. To illustrate, if you wanted to scan the vendor list for names beginning with the letters *Smi*, you'd simply have to type *SMI?* and the system will present you with a list on your screen or printer.

In its current form, the *Accounts Payable* module requires you to set up a vendor record for each payment that you process through the system. Attaché has said that a late fall enhancement will provide a facility for processing payments to one-time vendors more easily.

The system handles all the normal types of transactions, such as invoices, credit memos, journal entries, and check writing. You can create automatic vouchers to generate periodically recurring pay-

Figure 1: Attaché's General Ledger parameters screen.

1. The accounts can be formatted into three segments. Any time you key in an account number, you need only type in the characters; the program automatically separates it into its segments, separated by periods.
2. File control is particularly important when working with floppies, but the system performs much better when put on a hard disk.
3. The system allows for accounting periods ranging from one annual period to thirteen periods of 4 weeks each.

ments such as rent, lease payments, and so on. When invoices are entered, the debit side of the entry can be distributed to as many as 14 accounts. (Automatic vouchers are limited to six ledger account distributions.) This could be a drawback if you have a large number of departments or employee expense accounts. At period end, all these account distributions can be accumulated by account, and a summary entry will be automatically posted to the general ledger.

Check printing is limited to a single fixed format, with sample forms being supplied with the *Accounts Payable* module. Payment selection may be manual or automatic. You can pay multiple invoices with one check or you can be selective about the invoices that you pay. The auto-

matic selection procedure can be used to mark a full range of invoices for payment, and then within that range, a few invoices can be manually excluded.

The *Accounts Payable* module can generate five kinds of reports: a vendor master listing, aged trial balance, cash requirements report, purchase journal, and a payments journal.

Business Pack I

Attaché's *Business Pack I* contains the *Invoicing/Sales Analysis*, *Accounts Receivable*, and *Inventory Control* software. These three modules are simple and straightforward. If you purchase Attaché's *Business Pack I*, you will find that it's relatively easy to set up and use. Although this is good news, unfortunately this sim-

Next page of transactions? (Y/N) Y

Figure 3: A Customer Inquiry screen from the Accounts Receivable module.

1. A credit limit may be established for each customer. During invoicing, if this limit is exceeded, the operator will be alerted to override the limit or cancel the sale.
2. Each customer can be assigned a territory code.
3. Each inventory item may be assigned up to three prices. In turn, each customer can be assigned a given price level to use as a default during invoice processing.

plicity comes at some expense. The three modules in this set of software are less sophisticated and have fewer features than similar offerings with comparable prices. This is not to say that these systems will not satisfy the requirements of many small businesses, but it's important to have a clear understanding of what this software can and cannot do for your business.

The greatest shortcoming of the "preliminary" *Invoicing, Accounts Receivable, and Inventory Control* modules we reviewed was the lack of an automatic interface with the *General Ledger* module. Frankly, not having to deal with the financial accounting linkages makes it easier to understand and set up the individual modules. But this benefit is short-lived, because ultimately you will have to "book" the transactions you process with the *Business Pack I* software. As noted above, however, Attaché is developing software to allow you to automatically interface these systems with the *General Ledger*.

Invoicing/Sales Analysis

The invoicing capability automates your customer billing procedures and also provides a credit memo processing capability. To process an invoice, you simply enter the invoice "header" information, followed by information about the items sold (item number, quantity, price, discount, and tax status). The system can be closely integrated with the *Accounts Receivable* and *Inventory Control* modules so that most of the information required during invoicing is retrieved automatically from your customer and inventory files. Invoice, statement, and credit memo printing formats are fixed; special computer form samples are enclosed with the Attaché software.

The sales analysis system consists of a single sales report that can be sorted and summarized in a multitude of ways. Sales invoice detail can be listed, or the information can be summarized. Quantities, dollar amounts, costs, margins, and gross-profit percentages are listed for the current

ATTACHÉ

period and year-to-date. Average selling prices and average costs are also reported for each product item. Moreover, you can request subtotals for each customer, inventory item, item group, or for any of the three user-established sales codes that can be assigned by the *Accounts Receivable* system.

Accounts Receivable

The *Attaché Accounts Receivable* module can help you keep track of your customer or client receivables on a "balance forward" basis (that is, by maintaining an aggregate balance due for each customer) or an "open-item" basis (maintaining balances due for each invoice). This determination can be made for each customer, and you can change methods at any time. This system can be used most effectively when integrated with the *Attaché Invoicing/Sales Analysis* and *Inventory Control* modules.

A master record for each customer can be established for processing invoices, credit memos, cash receipts, and miscellaneous account adjustments. As in the *Accounts Payable* module, each customer is identified by a six-character alphanumeric code, and a four-character code can be established as the alternate key, allowing you to produce reports sorted by order of this alternate key.

Figure 3 shows a typical Customer Inquiry screen; Figure 4 shows the second screen, which details all the invoices rendered and cash received on an account.

The *Accounts Receivable* system has one unique option that could be quite useful if any of your customers are branches or divisions of a larger company. This feature allows the operator to set up both a head office account and subaccounts for the associated branch locations. Transactions may be entered against any of the branch subaccounts, and for accounting purposes they will be accumulated against the head office account. Invoices and credit memos entered against any branch will update the branch's sales details and update the aged balances of the

Figure 4: The second screen in the customer inquiry mode shows the details of all the invoices rendered and cash received on that account.

head office's account, as will cash receipts and journal entries. The head office's customer statement will provide transaction detail from all branches. This could be particularly handy when you have to ship to many locations but prefer to bill and collect from only one.

The system is quite flexible in allowing for sales tax recording and accounting. You can establish up to 999 different sales tax rates. For each rate, you can establish a 20-character description, the tax rate, and an upper limit to be placed on the tax applicable to any single purchase. In addition, you can determine how tax calculations should be rounded and specify whether taxes should be applied to miscellaneous charges (freight, insurance, and the like).

The *Accounts Receivable* system can also provide the user with a bank deposit slip for customer checks entered in payment of accounts.

You can establish up to three two-character sales codes for each customer. These sales codes are used to categorize custom-

ers for sales analysis and report selection. This is a nice facility, as it allows you to segregate and report your sales as a function of a specific territory, state, sales representative, sale type, and the like.

Inventory Control

The *Attaché Inventory Control* system provides a simple means of tracking inventory units on a perpetual basis. Separate procedures for physical inventory are provided for as well. One of three inventory costing options can be used. With "Average" costing, the value of new items received is averaged into the cost of existing items to produce a new moving average price. With "Fixed" costing, the cost of inventory must be modified manually (as an adjustment). When items are received, the difference between the price paid for an item and this fixed cost is reported as a "buying" variance. Finally, with "Last" costing, the cost of an item is a function of the last inventory receipt of that item, and, as above, the revaluation of existing inventory is accounted for as a

EVEREX

EVER for EXcellence

2 years
warranty!

Everex Storage Subsystems Plug Right Into Your Business!

Everex combines **Reliability, Support, Ease of Use and Best Price Performance Ratio** into a full product line of internal storage subsystems and plug-in controller cards. Now you have no excuse not to turn your IBM® PC into an XT! Actually, more than an XT, when you combine our **Half-Height** hard disk with our **Half-Height** streaming tape.

Hard to believe? Well, believe this, both the hard disk and streaming tape **Plug Right Into Your System**. Incredible? Unique? That's EVEREX for you.

Plug-in Subsystems

■ **Hard Disk Drive** with Everex Controller Card — we're offering you anywhere from 10–40MB of storage, in half or full height, that you can directly plug into your PC with **No Software Patch Required**. And we are so confident of our Hard Disk Drive that we are backing it with a **FULL TWO-YEAR WARRANTY***. All this starting at a **LOW** suggested retail of \$1,195!

■ **Streaming Tape** with Everex Controller Card — you get 20–45MB of high-performance back-up storage in minutes. And **REMEMBER**, this is a half-height streamer! The price is something to remember too — starting at **ONLY \$1,135** suggested retail.

Combined with the half-height hard disk, you've got something you can really talk about — an XT that backs itself. Only from Everex.

Controller cards sold separately:

■ **ULTRA DISK™** — Controls both the hard disk and floppy disk drives at the same time, saving you both space and money. Suggested retail — \$525.

■ **Floppy Disk Controller** — easy to install at \$220 suggested retail.

■ **Streaming Tape Controller** — direct plug-in and very reliable. Suggested retail — \$315.

Want to know more? Just ask your local dealer for all the details.

*Two-year warranty on Hard Disk Drive, one-year warranty on the controller card.

OEM Inquiries Welcomed.

AST brings you the perfect 4-5-6 for your Lotus™ 1-2-3.

Introducing the MonoGraphPlus™ Graphics Card.

Lotus 1-2-3™ is probably the most-used productivity software around. The trouble is, you can't display 1-2-3 graphs on your IBM monochrome display.

That's why AST developed MonoGraphPlus™ for the IBM PC and XT. It replaces IBM's monochrome card, permitting high-resolution bit-mapped graphics and text on the monochrome display.

But our MonoGraphPlus gives you much more. While Lotus offers three useful programs (1-2-3) in one software package, MonoGraphPlus gives you three additional hardware features (4-5-6) on a single card: a printer port, a serial port, and a real-time clock-calendar. Our comprehensive documentation will even show you how to get an extra two lines of text on your screen.

So now you can produce high-resolution, flicker-free graphics without giving up the high-quality text display that

makes IBM's green monitor so popular. You can also expand your PC's memory with our MP series of memory cards, turning your PC into an even more powerful workstation capable of producing very large spreadsheets with instant charts and graphs.

Leave it to AST to offer yet another state-of-the-art enhancement product for the PC. You see, we're the world's leading supplier of enhancement products for the IBM PC, offering a complete family of multifunction cards, communications emulators, and local area network products.

To get the perfect 4-5-6 for your PC see your local computer retailer, or contact AST Research Inc., 2121 Alton Ave., Irvine, CA 92714. (714) 863-1333.

MonoGraphPlus Graphics Card

"buying" variance.

For reporting purposes, gross profit from the sale of an item can be expressed as a percentage of either sales or cost.

The inventory maintenance functions can be used to add, modify, or delete inventory items. Printing an audit trail is optional. (Frankly, we'd prefer it to be done automatically.) As with most of the other Attaché system reports, you can choose to defer the printing of the report. (It's spooled to a disk file for printing at a later time.)

Inventory item codes of up to 10 alphanumeric characters serve to identify each item. The description field can be up to 20 characters in length. The item inquiry function provides a very nice feature that allows you to type "?" as the item number—the system will display a list of the items on file. (This feature is provided for some of the other functions as well.) This is a real help if you forget an item number and you don't have many items to keep track of. Further, if you are systematic in creating your inventory item IDs—such as widget1, widget2, and so on—you can mask your item inquiries by keying in, for example, "wi" to obtain a listing of all your widgets.

You can also specify a two-character item-group code and an eight-character bin location. The group code also allows you to classify and segregate your inventory items for reporting purposes.

The entry of inventory transactions is very straightforward. You can enter issues, receipts, returns, or adjustments. However, in most cases, issues would be posted automatically as a result of the invoicing process. An audit trail listing of these transactions is provided automatically by the software.

The physical inventory functions allow you to create a special physical inventory data disk, print physical inventory worksheets, enter physical counts, print a physical inventory variance report, and automatically update inventory files with the physical inventory quantities.

You'll find a curious, if not worrisome,

option on some of the Attaché *Business Pack I and II* menus: "Check the Integrity of Data Files." The first thing we asked ourselves was: Why would we ever want to do this? Worse, why would we ever have to do this? Well, apparently the disk file access methods employed by Attaché utilize a set of pointers resident in the PC's memory to organize and access certain data files. If the system is abnormally terminated, this information can be lost and must be reconstructed. This is not a major shortcoming, but you'll have to keep this

The Attaché Inventory Control system provides a simple means of tracking inventory units on a perpetual basis and separate procedures for physical inventory.

in mind as you use the software. If your local electric utility does "pull the plug" on you, you'll have a means of recovering the data. The section of the documentation entitled "Read Me First" has a useful section on developing a data backup rotation policy.

Updates on the Way

At COMDEX in May, Attaché announced an update to the *Business Pack* accounting packages that they call *Passport*, available to Attaché customers at no charge. It will contain two major enhancements. One major feature of *Passport* will provide interfaces (both import and export) to a number of popular productivity software packages including Lotus' *1-2-3*, *dBASE II*, and *WordStar*. The second

major facility of *Passport* is a general-purpose report writer that will enable you to prepare customized reports for any of the applications. A *Payroll* package is under development and is expected to be available soon. Attaché is also developing other system-wide enhancements, including most notably on-line help and tutorials, passwording, and support for multi-user/multitasking environments. The company expects to release these enhancements in the fall.

Documentation

The documentation is designed in flip-chart style, with the cover forming an easel of sorts. The system is so simple that you probably won't need the documentation for long. You can use the attaché cases for your own purposes while giving Attaché Software a little free publicity (the company name is embossed on the side of the case).

When presenting the main menu, the system continually reminds you of the percentage of disk space remaining. If the remaining space is within about a 10 percent threshold, you get an annoying but effective beep and message on each screen to remind you to perform the necessary disk file housekeeping and backup procedures. And, speaking of the organizing of disk files, we were somewhat disappointed to discover that the software must be loaded into the root directory of your hard disk (that is, you cannot use the software in a DOS 2.x subdirectory). We assume that Attaché will be addressing this in a forthcoming release.

While these systems are simple and have fewer features than some comparable accounting packages on the market, they should satisfy the needs of many small businesses, particularly if their simplicity results in savings on training time and expense. What Attaché's initial offerings for the U.S. market lack in sophistication, the company is attempting to compensate for with an aggressive post-sale support program. —G. William Dauphinals and Mike Yesko

"Excuse Me,

Make Way For Hayes' Please.

An advanced, easy-to-use data management system for the IBM® PC and compatibles.

Want to get your paperwork out of a clumsy file cabinet and onto your PC's screen, where you can manage it better? Frustrated with data base software that's either too limited or too difficult to use? Hayes offers you a simple word of kindness.

Please™ A powerful, yet easy-to-use, system for organizing and managing your information. *Please* is flexible enough to store any data you enter, and it'll return data to you in exactly the form you need. *Please* does more.

It does it all faster. And it's sure to please!

"The menu, Please?"

Menus list all your options and tell you exactly which keys to press for every *Please* feature.

That's to be expected. As the telecomputing leader, Hayes built its reputation on quality design, rela-

bility and customer support. Now these same standards have been applied to a new data management system that is going to instantly change the way you do business!

Say you're looking for an efficient way to maintain sales data. *Please* leads you every step of the way in creating a sales database that might include names, addresses, dates and figures. These categories are called "fields" in database lingo, and they're the very heart of your database structure.

Want last month's total in a particular region? Press a few keys and it's yours! A few more keystrokes and you'll know who's moving product, and what's your biggest seller.

Please will supply you with labels for a mailing to selected customers. It can send customer information to your word processor for a promotional letter. And it can receive data from

your spreadsheet program. *Please* will even look up a name and company for you, your Hayes Smartmodem* will dial the phone number, and you're ready to talk!

Taking this same sales database, you might also want to define special

fields for a custom Output Plan.

With a defined field for "COMMISSIONS DUE,"

Please can automatically compute each salesman's commissions, and print them out in a report of your own design. All this and more, just for saying "Please!"

And if you ever change your mind and want to change the structure of your database, please feel free. Step-by-step instructions show you how.

You have the same flexibility with any database you and *Please* design. You can store up to 16 million records and 200 custom Output Plans for each database! More than you're likely ever to require. But isn't it nice

"Make it snappy, Please!"

Need a report fast? You and *Please* can put together a Quick List in a matter of seconds.

Please.

"Put it here, Please."

Design a special screen format to position data in a particular place.

Just in case you ever need it?

Now you might think that a data management system that does all this must be difficult to use. Right? Rest assured. *Please* works hard so you don't have to. An easy-to-follow sample disk shows you everything you need to know to create your first database. Three *Please* menus show you which keys to press to access every feature. And whenever you need it, *Please* provides on-screen HELP messages, tailored to a specific task. So you needn't waste time reading through a list of unrelated instructions on your screen. Or stop what you're doing to consult a manual. In no time at all, and with no assistance at all, you'll be a *Please* database pro!

knowing all that storage power is there?

Everything about *Please* is designed to save you time and effort. So what could make data management even easier? *Please Application Templates*, that's what!

To help you get up-and-running immediately, we've developed a series of practical, pre-designed templates. You'll appreciate their well-thought-out structure, and "fill-in-the-blank" ease. Choose several! For business and personal use.

"Merge these, Please!"

Combine data from one database into another, without changing your original.

Including *Mailing List*, for storing names and addresses and producing mailing lists. *Contacts*, for man-

aging facts and figures about your sales contacts. *Applicants*, for following applicants throughout the interviewing process. *Appointments*, for maintaining your calendar and tracking all of your business expenses. *Household Records*, a complete home management system. And more! Your dealer has details!

Buy *Please* now!
Get a FREE *Mailing List* template from your dealer.

Second FREE template of your choice, direct from Hayes!

Help yourself. *Please!* And take advantage of these two valuable offers. See your dealer right away!

Stew Leonard, Jr., in his office with his PCs and chicken.

APPLICATIONS • CHERYL J. GOLDBERG

MILK, BUTTER, CHEESE, AND PCs

Stew Leonard's World's Largest Dairy Store is known for its Disneyland-style marketing. But as at Disneyland, behind the store's hype are some technical marvels—nine PCs.

Photograph: Terry Hanagan

A marquee-size computerized sign heralds the approach to Stew Leonard's "World's Largest Dairy Store" in Norwalk, Connecticut. Next to the sign is a petting zoo. Roaming the 500-car parking lot and handing out candy to children is a 6-foot cow! (It's really a 6-foot man in a cow outfit.) A realistic plastic cow guards the entrance, ushering you into the one wide—and crowded—aisle that winds its way through the entire store. You first pass the bakery, then the milk packing plant, where milk is packaged before your eyes. A woman in a cowgirl outfit hands out pizza samples. In the produce and meat departments, you can view workers portioning, weighing, and wrapping products. Stew Leonard has said that Walt Disney was the greatest marketing genius ever. Disney's influence is apparent throughout the store.

Stew Leonard, originally a milk deliv-

eryman, opened the dairy store in 1969 and he has expanded his building 22 times to its current 100,000 square feet. It remains a family-owned, single-store operation. Over 100,000 people visit each week, purchasing 1,000,000 cartons of yogurt, 10 tons of cottage cheese, and more than 36,000 pounds of butter each year. The *New York Times* has called Stew Leonard's "one of the most remarkable success stories in American food retailing."

Enter the PC

Although the supermarket industry is just beginning to explore the use of PCs, it should come as no surprise to anyone familiar with Stew Leonard's that the store was one of the first to buy them. "Stew Leonard is a progressive thinker and very innovative," says Jeff Pirhalla, the store's data processing manager. Leonard's was the first supermarket in the state of Connecticut to install a scanning system back

in 1976. Before the year is out, the store will be able to boast a network linking the store's 30 cash registers to a mainframe and to several PCs.

"We've found that if we spend money on new things, they pay for themselves," says Stew Leonard, Jr., vice-president of the company. It was Leonard, Jr., 29, a recent graduate of the University of California (Los Angeles) MBA program, who persuaded his father to try out PCs about 2 years ago, and he is responsible for their operation.

"After I graduated and came back here to work, I said to my father, 'I'd really like to get a personal computer.' He said, 'Look, I don't know anything about it, but all you gotta do is tell me you'll use it and that it'll pay for itself and you can go ahead and buy it.'"

Leonard purchased one PC with a monochrome monitor and a NEC printer in 1982. Now the company has nine additional PCs plus a Compaq portable and a graph plotter. He chose the IBM PC because he was already familiar with the quality of IBM typewriters and because he figured that if it didn't work out he could get a higher resale value on an IBM than on most other machines. He experimented with the *VisiCalc* and *SuperCalc* software packages before finally settling on Lotus' *1-2-3*, which, he decided, was the most comprehensive and versatile. He uses *WordStar* for word processing.

To learn how to use a PC, Leonard, Jr., worked with *1-2-3* to figure out the best way to remortgage a \$5 million loan. He spoke with three banks, each offering different terms for the loan. The original bank charged a prepayment penalty and required a lump-sum payment for the remainder of the loan. One of the new banks would charge a lower interest rate, but a few percentage points as a fee up front. Leonard loaded all the information into the PC, figured out the net present values of the payments on all the loans, and decided which bank gave the best deal.

Now Leonard uses the store's PCs for

A realistic plastic cow guards the entrance, ushering you into the one wide—and crowded—aisle that winds its way through the entire store.

corporate planning, budgeting, and forecasting. One of the first things he did along these lines was to enter the weekly and daily sales figures for a 3-year period into the 1-2-3 spreadsheet. Currently, Leonard manually plugs in sales and customer count figures taken from hard copy that is generated by the company's mini-computer.

Tracking Sales

Using 1-2-3, Leonard can compare sales figures for any week with those of the same week the previous year. His sales goal this year is a 20 percent increase over 1983 sales—which he claims the PC is helping him meet. One column of the spreadsheet lists the projected sales for 1984 based on the 20 percent increase. Once daily sales figures come in, the PC calculates the actual percentage change from last year. If sales are down, management asks whether the decline was caused by a holiday, or whether another store ran a big special. If sales have increased, perhaps an ad or special was particularly effective.

Graphs of 5-week moving sales averages allow Leonard, Jr., to visualize the store's sales. Asterisks indicate specials or ads. Through these 1-2-3 graphs, Leonard has verified that peak sales usually occur when the store runs a special. As a result, says Leonard, the store has quadrupled its advertising budget and now runs truckload specials at cost. The store advertises the truckload specials on the huge computerized sign out front. Says Leonard, "It's fantastic, unbelievable. A supplier came in the other day and said, 'Please don't put my cantaloupes on that road sign; we won't have enough.' We change that sign and, boom! The products move right out of the cases."

In addition to charting sales for the entire store, the PC breaks out sales totals for each of the store's seven departments—grocery, dairy, ice cream, meat, deli, produce, and bakery. The breakouts help department managers plan their sales strategies and clue in Leonard on depart-

Pastry Process Control

In Beth Leonard's in-store bakery, a PC helps her determine how much to produce every day.

Beth's Bakery sells more than a million freshly baked chocolate chip cookies per month—20 times more than any other in-store bakery, according to the Food Marketing Institute. A PC keeps the operation running smoothly.

The PC sits in the far corner of Beth Leonard's (another of Stew Leonard's children) office, silently supervising. Leonard uses the PC to plan production and track sales. The information from one calculation feeds the other. The PC creates graphs of 4-week average sales figures that help Leonard determine what baked goods and how many to prepare on any day of the week based on sales of the same day in previous weeks. Preparing just the right amount of each product, in turn, fuels sales.

The PC gives Leonard a printout of how long different steps in the production process should take and how many workers are needed to perform them.

Since each batch of product is always the same size, Leonard doesn't use the PC to alter the proportions of ingredients. Instead, she varies the number of batches and thus the amount of time it takes to complete each step in the process. The PC's control of production allows the bakery to produce continuously, no matter what the expected sales, keeping goods right-out-of-the-oven fresh.

Using the PC has also helped Leonard determine the best way to run specials. The bakery used to run a "buy two, get one free" special on croissants. But by graphing sales, says Stew Leonard, Jr., the company saw that the special "put her sales through the roof. There was a huge jump in volume, then sales dropped below normal. People were buying a lot of croissants on sale and freezing them." Now, Beth Leonard just takes 20 cents off the price of croissants. This strategy spreads sales out more evenly. —C.G.

TWENTY-SIX REASONS YOU SHOULD BUY A DIABLO PRINTER

Diablo

Reason 1: Diablo Leads The Industry

Diablo is a clear leader in the printer industry, the one brand all others compare to. Why go with any less than the original?

Reason 2: Clearly Superior Quality

Ask our customers. Datamation magazine does, in the most respected annual brand preference survey. And year after year their survey has shown Diablo daisy-wheel printers voted number one—by end users and OEM's alike.

Reasons 3-15: The Most Extensive Product Line

Diablo offers 13 different printers, from daisywheel to matrix to electronic, for every business purpose.

for every business computer. No other manufacturer offers as many.

Reason 16: Real Compatibility

Our universal interface for personal computers means that any of Diablo's API printers plays with every major brand of personal computer. Including IBM's.

Reason 17: Reliability

Compare Diablo printers to the competition. Our printers run longer between servicing than the others, model for model, across the board.

Reason 18: Over 1200 Diablo Dealers

Diablo printer products are available throughout the US and Canada at over 1200 locations.

Reason 19: Genuine Diablo Supplies and Accessories

Diablo doesn't even stop there. We offer over 300 printwheels,

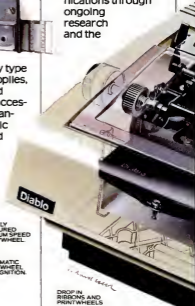

ribbons for every type of printer, ink supplies, cleaning kits, and paper handling accessories like mechanical and electronic sheet feeders and forms tractors. Diablo has everything you need for computer printing.

creative application of technology to every-day business life worldwide. And we will continue this endeavor as long as there are discoveries to be made.

Reason 21: Service for All Diablo Products

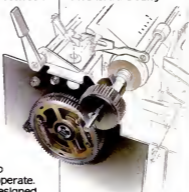

The worldwide network of Xerox and Diablo service centers stands ready to provide fast and economical service. Couple this with the technical and service hotlines and you've got a complete support network.

Reason 22: Nothing But Printer Products
Diablo makes printer products and nothing else. We make no compromise between printers and other system products. Other printer companies do.

Reason 23: We Make Printers Easy

All of our printers are easy to set up and easy to operate. They were designed that way, because they're supposed to be used, not fussed over.

Reason 24: Tradition of Innovation
We're the leader in innovation. We always have been. Diablo invented the daisy-

wheel in 1972 and we've never looked back. We're constantly refining our products and looking for new ways to improve

the technology. That's why we're the only printer company that offers the variety of printers and technologies that we do. We simply don't believe in resting on laurels.

Reason 25: IBM®
IBM micros are here to stay. And so is Diablo. That's why we have developed such a complete line of IBM compatible printers. Whether daisywheel, matrix or color; correspondence or graphics, dedicated or API, Diablo's "IBM compatible" printers are just that.

Reason 26: Because You Just Can't Buy A Better Printer

No other printer company can say what we've said here. Nobody. And when you consider the importance of the investment you make in business equipment why would you settle for anything less?

Diablo® and Xerox® are registered trademarks of Xerox Corporation. IBM® is a registered trademark of IBM Corporation.

Above: Bar charts produced by Lotus' 1-2-3 show comparative hypothetical monthly sales between fiscal 1983 and 1984 in Beth Leonard's bakery. Below: Line graphs, also created with 1-2-3, compare sales figures for fiscal 1983 and 1984 in the dairy department. Asterisks at peaks in the graphs indicate specials, revealing that specials do indeed increase sales. In addition, the graph indicates that sales peaks generally occur around the same time each year.

ments needing closer attention. For example, week-by-week comparisons between 1983 and 1984 sales figures indicated below average sales increases in the dairy department. The company's cost accountant graphed moving averages of all the sales records with the PC, looking for trends. As a result of these calculations, the company has changed orange juice and fruit drink suppliers.

The company now has 400 employees, about 100 more than in 1983, but graphs of wages and overtime reveal the same peaks and valleys for both years. According to the graph, wages and overtime dropped in April of both years, rose in May, and shot up in June, in sync with the pre-Fourth-of-July rush. The company is currently developing a program for the PCs that will chart hourly customer count to help schedule its workers.

Leonard, Jr., has set up a macro using 1-2-3 that runs a series of graphs—5-week moving averages, customer count, wages and overtime, and so on—for the entire store and for individual departments. He plans to videotape these "shows" for later use in corporate and departmental meetings.

Recently, the company began training department and production managers to use 1-2-3 for tracking sales in their own departments. "We'd like to have a PC in every department manager's office—even in the meat and deli departments," says Leonard.

At the corporate level, Leonard used the PC in March to project the yearly financial statement for the fiscal year ending the following May. By extrapolating the remaining months of the fiscal year from graphs for labor, costs, and so on, he made expense estimates for the rest of the year with which the other executives agreed. Once Leonard entered key variables, 1-2-3 set up all the balance sheet ratios: working capital, inventory turnover, payable days, debt to equity, long-term debt, return on investment equity, current ratio, debt to assets, and sources and applications of funds. Leonard says he

can get an entire financial statement from 1-2-3 and compare one year to another easily.

The Current Setup

"The problem right now," he says, "is that the PCs are standalones, just workstations. All the data has to be punched in, and it becomes a cumbersome job."

The store's computer setup has changed little since the scanning system was originally installed in 1976, although the company has subsequently doubled its computing capacity. Employees log deliveries and monthly physical inventory figures into two NCR 8250 minicomputers that automatically subtract sales from inventory. When the inventory level drops below a certain point, the minis produce a report reminding the buyer to re-order. The minicomputers also perform all the accounting functions for the store: general ledger, payroll, and accounts payable.

Everything that comes into the store, or

that is packaged or produced within it, has a Universal Product Code (UPC). "We reject items that don't have the UPC," explains Leonard. As products sell, 25 cash registers within the store and 5 outside at the flower and ice cream stands collect sales information through the UPCs. Programmable keys on the registers also track items, such as dog food, that are too bulky to run over the bar-code reader, or ice cream cones that melt too quickly to carry a code.

The cash registers send UPC and cash flow information to two NCR 726s. One of these minicomputers runs the system and records all the information on a cassette tape. The other acts as a backup to the first and makes a duplicate copy of the information.

Through action codes on the NCR 726, the money room can obtain reports of gross intake, how much cash is in each machine at the beginning of the day, total cash, checks, food stamps, and vendor

coupons in each drawer, the amount that has been picked up, and the amount of money left in each drawer after pickup. According to a money room worker, "We can tell immediately if a register is a penny over or a penny short. We can tell whether the money came in as cash or as a check. Before the system was installed we could only tell if the cashier was over or under."

Not only does the NCR 726 monitor the cash flow in each lane, it also keeps track of the cashiers. Each cashier is assigned an action code and logged in through the code at the beginning of each day and logged out at night. In this way, the store can follow the cashier from register to register, reducing the probability of employee theft.

The minicomputer loads checking in-

Above: The two NCR 9300 mini-mainframes will be the heart of the new computerized system. Sales information will come into the system through the scanners at the cash registers (left) and will then be channeled into two NCR 726s. The NCR 9300s will collect the data over the modem and use it to update the company's database.

Two ways to show off your IBM PC.™

There's no better way to show off your IBM PC – or any other micro – than with the new line of Toshiba printers. They offer state-of-the-art features, high reliability and low price.

P1351

The new Toshiba P1351 printer has a unique high-density 24-pin dot-matrix print head. It lets you print crisp, clean letter copy at 100 cps, draft copy at 192 cps. And with the software-selectable downloading fonts, you get to pick from a variety of type styles.

The P1351 has more stuff to show. Like 180 x 180 dots-per-

inch high-resolution graphics, 132-column-width platen (great for spreadsheets and Lotus™ 1-2-3™ data processing and graphics), Qume SPRINT 5™ emulation, and a choice of either a forms tractor or automatic sheet feeder.

P1340

For considerably less, the new P1340 gives you just a little less. But it still has the same high-density 24-pin dot-matrix print head, the 180 x 180 dots-per-inch graphics resolution, and the Qume SPRINT 5 emulation. In addition to true proportional spacing and a

built-in forms tractor. Whichever printer you choose, nationwide service within 24 hours by Western Union technicians is available.

So the choice is yours. But when you choose Toshiba, you know you're putting on the best show possible.

For more information, call toll-free: 1-800-457-7777, Operator 32.

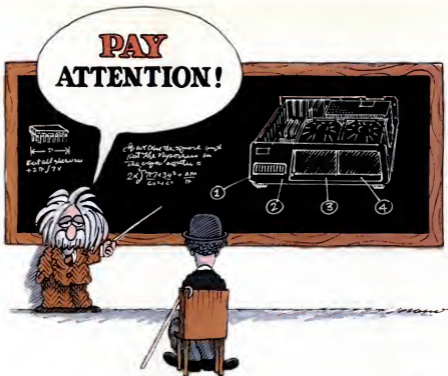

IBM PC to P1340 and P1351 graphics utilizes PaperScreen and the IBM PC with color graphics adapter. IBM PC is a trademark of International Business Machines. Lotus and 1-2-3 are trademarks of Lotus Development Corporation. SPRINT 5 is a trademark of Qume Corporation.

BRING OUT THE GENIUS IN YOUR PC.

Now you can do it, with Sigma Designs' Expansion system. Raise your personal computer's I.Q. to XT level and beyond. Sigma gives you room to expand with almost twice the capacity of any other system on the market. Yet its quality, performance and versatility can be yours, for much less.

E = MC³ (Expandability = More Capabilities³)

The Sigma Expansion Chassis provides 9 card slots, room for two full height 5 1/4 inch disk drives, and a heavy duty power supply. Thanks to its DMA support, all commercially available expansion cards can be installed, including those with memory. The chassis' easy installation, attractive design and rugged construction make it the perfect complement to any system.

Relatively Speaking. We've Got A Drive For Every Need

Upgrade your PC to an all powerful tool. As a sophisticated disk subsystem, our chassis can be configured with any of the following storage devices (photograph, left to right): Streaming Tape Back-Up (20, 40, 60MB); Half Height 10MB Hard Disk Drive; Half Height 2.8MB Floppy Drive with preformatted media for back-up (it can also read standard 48/96 TPI diskettes); Full Height Winchester Hard Disk Drives (10, 15, 33MB).

information on the store's 50,000 courtesy card holders into the 726, which assigns a lock-up status code number to customers who have passed too many bad checks. If one of these customers tries to pay by check, the cash register locks up and the cashier is unable to take the check. The company also uses the courtesy card information for advertising: it runs more advertisements in locales populated by larger percentages of card holders.

The 726 records the lump-sum sales total per day and provides a sales velocity breakdown for each hour the store is open. The store uses sales-velocity-per-hour information to help schedule the right

The company is currently developing a program for the PCs that will chart hourly customer count to help schedule its workers.

amount of help; in the future, the PCs will help with this task.

At the end of the day, cassettes are taken from the 726s and loaded into the 8250, which sorts UPC information by item and department, updating its database. The mini also prints figures, which are entered manually into the PCs, including the price of goods and quantity sold, cost to the store, "add-on" costs of putting the product on the shelves, and gross profits.

A New Network

An all-inclusive network (see Figure 1) is due for completion in a matter of months. The new network will perform all

Design an IBM PC system layout that's comfortable.

the functions of the current system, but it will link up all the pieces. In addition, two NCR 9300s mini-mainframes will replace the 8250s, which will be relegated to store-energy management.

The 9300s will communicate by modem with the 726s. The 9300 will dial the 726 system downstairs; once the two systems exchange identification, the 726s will send the information over the line.

NCR's Decision Mate V, a microprocessor with a 10-megabyte Winchester hard disk, will act as network manager for the company's ten PCs and one Compaq, relaying figures—for sales, customer count, wholesale cost of the products, "add-on" costs of putting the product on the shelves, and gross profit—from the 9300 to all the PCs.

Leonard, Jr., estimates the payback period for the \$300,000 system to be 4 or 5 years. The return will come from the store's increased ability to determine which products sell best in different seasons, enabling it to fine-tune its product selection. It's a maxim in the supermarket industry that 80 percent of the profits come from 20 percent of the products. Stew Leonard's aim is to sell the most profitable 20 percent. Thus while most supermarkets sell about 14,000 products, Stew Leonard's sells only 700 to 800. The new system will monitor check-cashing history more closely to cut back on losses from bad checks. In addition, the system will include electronic time clocks, eliminating paper time cards and cutting down on costly labor to process the cards.

Leonard, Jr., likes to plan far into the future. "We'd eventually like faster feedback and everything done as graphs," he says. Does he also dream of opening more Stew Leonard's dairy stores? He shrugs, and feigns hesitation. He admits that he would like to operate additional stores—and put computerized cash register terminals in them that would be connected by modem to the main store. "But," the son says, "my father's philosophy has been to put all your eggs in one basket and watch the basket."

improve productivity

We deliver the information age to you ...

...today, within reach of your telephone, there are information utilities with almost any data you could ask for.

If you have Crosstalk and a modem, you have what it takes to hook almost any business microcomputer into this incredible information network.

The most widely used communications program available, Crosstalk helps your computer transfer data to and from other microcomputers, dial-up mainframes, and information data bases that provide data to the public.

CROSTALKTM

You can gather the world's latest news, look over the most recent hourly stock prices, check an airline schedule and make a reservation, get the recipe for Chicken Kiev, find out the weather forecast for Paris or Peoria, do research on the wines of Bordeaux, or answer complex legal questions.

Almost anything you need to know is now within your reach.

Crosstalk is available for most small business computers including IBM, Victor, Texas Instruments and DEC. See your nearest computer retail store, or write for the details.

ONE LANGUAGE. ONE SOLUTION.

PC/FOCUS

PUT THE DATABASE POWER OF A MAINFRAME IN YOUR PC.

Now you can turn your Personal Computer into a mainframe-level applications development system with **PC/FOCUS**, the most powerful DBMS available for your PC.

As a tried-and-proven, user-friendly, 4th generation system, **PC/FOCUS** gives you the ability to query and report from files, build systems and manipulate data. It incorporates a relational database, screen manager & report writer, and offers dramatic abilities in graphics, financial modeling and statistical analysis.

But unlike older database technologies which require training and practice to master, **PC/FOCUS** uses simple English

statements you can learn in minutes! In fact, just a few moments of familiarization with **TableTalk™** its new natural language window, is all that's needed for even a novice to become immediately productive.

Best of all, **PC/FOCUS** lets you download data extracted from mainframe files and DB's, then upload data and procedures from the PC to the mainframe for production execution. So your PC becomes almost as powerful as a mainframe, and you become almost as capable as a trained systems analyst.

Let **PC/FOCUS** with **TableTalk™** unlock the mainframe power hidden within your PC. For de-

tails, fill out and mail the coupon or write to **Don Wszolek, Dept. P15, Information Builders, Inc., 1250 Broadway, New York, NY 10001.**

Dear Don:

Yes! I'd like to unlock the mainframe hidden in my PC with **PC/FOCUS**. Mail full details to:

P R O J E C T:

DATA BASE

Part 7

In this installment of our series reviewing databases for the PC, we cover the top-of-the-line programs—those in Category 4. They include, among others, the long-awaited dBASE III.

Ever since the June 12 issue of *PC Magazine* (Volume 3 Number 11) bearing the first installment of "Project: Database" appeared on the newsstands, we've been receiving letters and phone calls from corporations and consultants asking one question: What are the names of the Category 4 databases?

The quantity and urgency of the calls reflect the shift from mainframes to microcomputers for major corporate applications. The callers explained that their companies were preparing to invest a great deal of money and effort in designing and building an application to be used on the PC, and business pressures simply wouldn't allow them to wait until late summer to make a decision.

Here, finally, are those database packages for the IBM PC that we deemed to be in Category 4. These software packages had to meet all of the requirements of the preceding categories; that is, they had to possess the ability to handle two or more files simultaneously and a procedural language or other means for performing programming operations against the database. But the Category 4 packages also had to be

outstanding, unique, or revolutionary in some other way. Most go beyond database processing and are better described as application generators. Each one provides enough database processing power to create full-fledged business applications. The nine products in this seventh installment of "Project: Database" are the cream of the database crop.

SAVVY PC wins the prize for uniqueness—it uses a pattern-recognition algorithm to assist the user in developing a personal language. *power-base* is special in that it gives the end user a great deal of almost effortless power via a menu-driven system. *SALVO* is a finely wrought example of a relational database management system that can be used by both nonprogrammers and advanced practitioners.

Revelation is unusual in that it runs under the PICK operating system (though it will also execute DOS commands). *DataFlex* is special in that it supports single- and multi-user systems as well as 8- and 16-bit machines. *PC/FOCUS* communicates readily with its mainframe cousin *FOCUS*.

informix, originally written in C for

UNIX systems, was recently made available to run under DOS. *KnowledgeMan's* query language is based on IBM's SQL, and the program has optional screen painting and graphics utilities.

Fittingly, the last review in this series is of *dBASE III*, the successor to *dBASE II*, the database software that started it all. The enhancements in *dBASE III* respond to the demands of microcomputer users for increasingly sophisticated database managers. Database buyers are looking for packages that, at all levels of power, will do more of the work for the user and allow greater flexibility in defining and processing the data at hand.

In such a high-demand, high-stakes market, nothing stays still for long. So in the next issue we will describe the enhancements, new versions, and the new database products that have appeared on the market since the initiation of the "Project: Database" series. But, for the moment at least, we can take a short rest, assured that we've seen all the database software, from Category I through Category 4, currently available for the IBM PC. —Stephanie Stallings

SAVVY PC: A Programming Labor of Love

0. Quit
1. Enter new employees
2. Move an employee to different dept
3. Give an employee a raise
4. List current data

3

```
Enter LAST NAME Dimeara
Enter FIRST NAME Stefano
Enter CURRENT SALARY 30000.00
Enter DATE OF CHANGE 10/18/82
```

After Option 3 is selected from a SAVVY PC user-defined menu, a series of four prompts appears.

SAVVY PC is fun! SAVVY PC is different! SAVVY PC is outrageously unstructured! What makes SAVVY PC so special? For one thing, SAVVY PC is the only product of Excalibur Technologies Corporation, a public corporation founded in 1980 and specializing in research on pattern recognition. The research for SAVVY PC, however, goes back 20 years. Excalibur gave SAVVY PC its own operating environment (including its own operating system, programming language, file manager, compiler, and linkage editor), automatic memory allocation, and a pattern processor based on Excalibur's Adaptive Pattern Recognition Processor. These functions are so completely integrated that it is difficult to

determine which one makes SAVVY PC so unusual.

Pattern recognition is one unique SAVVY PC capability. Its pattern processor enables SAVVY PC to recognize any word—in English or any other language—that you have first defined to it. However, much more important than the pattern processor is SAVVY PC's remarkable programming language. You will not fully appreciate SAVVY PC as an end user; you must get your hands dirty and write a program from scratch. As a programmer, you start with about 85 factory-supplied, fundamental programming elements. They include commands such as DISPLAY, DIVIDE, and GET; standard items such as INTEGER and FRACTIONS; standby tasks such as DIAGNOSTICS, ARCHIVE, and CONFIGURATOR, as well as many others.

With this relatively small but very versatile dictionary, you start building your own language—yes, your own language—by adding to it. You create natural language programs that emulate English. (The resulting database system that the end user sees can be in any language you like.) English sentences have nouns or names for things in addition to the verbs

that make up the bulk of the SAVVY PC-supplied dictionary. The nouns are called items in SAVVY PC. An item is a container for information. For instance, you can use the verb INPUT in the phrase INPUT the LAST NAME. LAST NAME is not in the supplied dictionary, so SAVVY PC will tell you that it has never seen LAST NAME before and will ask you if you want LAST NAME as an item. If you say yes, SAVVY PC will add the item LAST NAME to its vocabulary and wait for you to enter information, say JONES, into the item LAST NAME. LAST NAME, as an item, can now be used in a multitude of ways. You can enter the command DISPLAY the LAST NAME, and SAVVY PC will show you JONES. Incidentally, if you accidentally key in DSILPAY the LSAT NMAE, what you see on the screen will be automatically corrected to show DISPLAY the LAST NAME. The pattern recognition feature permits this automatic correction. SAVVY PC does not ask you to rekey any misspelled words. You never know that it has corrected your input. In fact, if you make a typographical error, you may not even be aware of the error. When more than one item in the dictionary might be appropriate to correct an entry, SAVVY PC presents you with a list of these items from which to choose. For example, suppose you typed the command SHOW the LENGTH OF because you wanted to see the contents of the item LENGTH OF PROMPT. When you originally entered the item in the dictionary, you did so with a spelling error, but later reentered it properly. Since SAVVY PC retains both versions of the item, and because LENGTH OF SHOW is also an item in the dictionary, SAVVY PC responds as follows:

I'm not sure what LENGTH OF refers to.

Is it one of these:

1. LENGTH OF PROMPT
2. LENGTH OF SHOW
3. LENGTH OF PROMPT
4. or None of the above?

Please type the number of the correct answer:

SAVVY PC

Excalibur Technologies Corp.
P.O. Box 26448

(505) 242-3333
List Price: \$395

Description: Relational

Requires: 64K RAM, 1 disk drive,
SAVVY PC's own operating system.

Records per File: 20,000

CIRCLE 766 ON READER SERVICE CARD

If you choose 4, *SAVVY PC* asks you if you wish to establish LENGTH OF as a new item. You can toggle off this recognition feature. If you do, everything you type must be correct.

New items that you create can be combined to form new commands. You do this by creating a *SAVVY PC* task. You name the task, and the name is added to the vocabulary for you to use over and over again. Complex tasks can be built by combining your library of simple tasks. You can combine tasks in any way and as often as you like. You can build as many tasks as you have disk space for.

Functions allow you to build more sophisticated tasks. A function is an instruction or a sequence of instructions with blanks to be filled in later. The blanks are called *arguments* and are marked by a series of numbers in angle brackets like this: <1> and <2>. For instance, suppose you have created an input screen to prompt you for the fields in the records of your database, and you wish to define where the actual data entries are to be made.

You first define a function that allows you to specify the item to put information into and where this item is to appear on the screen (for example, the line and column coordinates). You normally put this item to the right of or underneath the prompt for the item on the input screen. Assume that you have completed writing the task that puts the item prompts up on the screen. Suppose that you named that task *SHOW EMPLOYEE PROMPTS*. Call your new function *ENTER* and define it with three arguments. The first argument allows you to enter the name of the item where you are going to put information. The second specifies which line of the screen the data entry for the item will begin on, and the third specifies the column on the screen where the data entry for the item will begin.

You can now use this function. If you key in *ENTER*, *SAVVY PC* will generate "the item <1>." You might respond with *LAST NAME*. *SAVVY PC* will

respond with "on line <2>." You might respond with 5. *SAVVY PC* will respond with "at column <3>" and you might respond with 18. If you then incorporate this function in a task and execute the task, you will find your cursor on line 4, column 18, where you might key in *JONES*. If you displayed *LAST NAME* after keying in *JONES*, you would find that it contains *JONES*.

Now if you use this function (called

To fully appreciate SAVVY PC you must get your hands dirty and write a program from scratch.

ENTER) for each item that is to be entered and combine the functions with the task that displays the input screen prompts (which is called *SHOW EMPLOYEE PROMPTS*), you can create the complete input screen for your employee, *JONES*.

You could use this new task by keying in its name, *ENTER EMPLOYEE INFORMATION* (or *ENTER EMPLOYEE* or *EMPLOYEE INFO* or a multitude of other variations that will also usually execute the task). *SAVVY PC* would present you with the input screen and put the cursor at line 5, column 18, where you would start entering information for *JONES*. You could now define a task that would

allow you to view the information you have just entered for *JONES* on the screen. It would also be a combination of tasks and functions similar to the *ENTER EMPLOYEE INFORMATION* task. Then you would be able to enter information for *JONES* and, whenever you wish, view it again. But what about *SMITH*? If you enter information for *SMITH* instead of *JONES*, you will then lose the information on *JONES*, since you have defined a method of inputting and displaying information for only one person. If you wish to store information on many people, you must create a file, define a key, and provide the means for new records to be placed in the file. You might also want to write a routine that allows you to continuously add employees to the file until you are finished. You do all this by using a combination of commands, tasks, and functions.

Using *SAVVY PC*, you generally start from the very bottom, an element or item or field, and work up to a record and then a file, building in whatever nuances you desire as you go. This method is very different from that of the more traditional database managers such as *dBASE II*, which give you generalized tools that allow easy design of a file from the top down. They save you work, but they are also much more structured than *SAVVY PC*. In *SAVVY PC*, you don't have to create a file at all.

However, when we created the *PC* database system for the benchmark test, *SAVVY PC* did not require that we start from the bottom. In fact, we started by creating the files and telling *SAVVY PC* to create new items as we went along. We then built the tools that allowed us to enter data into the files and to index them.

Unlike more structured programs, *SAVVY PC* does not require you to specify field, record, or file lengths. *SAVVY PC* allows you any variable field size up to 255 characters as you input the field, and it fully controls and allocates the file space for your entries. The size of the actual data you enter is appended to the field in the

file. Anything can be entered unless you restrict the types of entries in your SAVVY PC tasks, in which case the fields begin to take on special characteristics.

In constructing the benchmark test, we built one query that accesses all three files and displays selected information from each of them. Finally, we incorporated all the tasks in a menu. We did not develop any provision to display the entered information on the screen or other functions that would be nice to have in a real-life environment.

SAVVY PC does not do everything in the generally accepted best way. For example, it has no SORT command. In order to sort the PC Magazine salary file, we created a task named SORT BY SALARY. This task creates an index file (SALARY SORT) that contains a key (SALARY ID), the employee number (EMPLOYEE #), and the last name and first name (EMPLOYEES INDEX) for each employee's most current salary record (ignoring old salary records). In the task that creates the index, we defined the key of the index file as CURRENT SALARY and EMPLOYEE ID (which is last name and first name) so that when we stored the employee number, last name, and first name in the index file, they were in order by salary, last name, and first name (SALARY ID). SAVVY PC will do this ordering automatically when it saves the file. Creating an index file for only the most current salary records rather than all of the salary records requires more processing than selecting all the salary records. We also created our report from this sorted file rather than by sorting the department file and spinning off the report from it. All three files are accessed for the report, which is produced in salary order.

Because of its pattern processor, SAVVY PC recognizes all the names you give to your tasks, functions, and items once you have defined them. You can also give your tasks and items names with more than one word. You could define tasks called BROWSE THROUGH THE FILE or PRINT NAME AND ADDRESS or

CLASSIFY ZIP CODES. You can rename these tasks or associate them with another name, a synonym, and therefore tailor the language for particular applications. BROWSE THROUGH THE FILE could be BROWSE THRU THE EMPLOYEE FILE, for example. You can even make these synonyms in another language. A Spanish-speaking database system? No problem with SAVVY PC.

There is a trade-off, of course, for this kind of "tailorability." You work at a

Because of its pattern processor, SAVVY PC recognizes all the names you give to your defined tasks, functions, and items.

very low level, and you must do a lot more to develop a system than is required by a higher-level language. The user of the system, on the other hand, never has to see compiled code or even the plain-language SAVVY PC tasks. If you do a good job, the user will have a tailored menu for the basic functions he or she performs and access to the data by using a natural-sounding language (mistakes and all).

Because such a free-form language might make the program slow, SAVVY PC's designers included some machine optimization facilities to combat the problem. SAVVY PC watches you and tries to optimize your performance. For instance, if you start browsing through a file (using a SAVVY PC task), SAVVY PC may read 20 records into memory when you start the task. As you browse, you may change a record. SAVVY PC marks this record in memory. At some later point it will know to save that record, which it will do if it is the only one that was changed. This pro-

cedure reduces the need for disk access. The system also does its allocations (buffer, memory, disk storage) differently, depending on what SAVVY PC observes of you and your application.

SAVVY PC programming is a labor of love. What if you are not interested in a labor of love? Excalibur still wants you to use its system so it includes with SAVVY PC a complete name and address file application called *Contacts* that can be used to keep track of customers, club members, employees, and so on. The entire system is easy to use and demonstrates the sophistication of systems that can be developed with SAVVY PC. The system was written in SAVVY PC, of course, so you can modify it or add to it as you wish. The *Contacts* system is also available as a sampler for \$24.95. We tested the sampler, which has a limited database of 20K and comes seeded with demo entries and sample reports. (The *Contacts* with SAVVY PC is not so limited.) For variety, a MONEY DUE file is also provided. The sampler features a fully developed database system and lets you fetch specific records; browse through records; search for a pattern of information; add, remove, and change information; design and run reports; or design a new database file. This last option will allow you to generate a complete file management system.

What else comes with the system? You get a PC manual (tutorial and reference guide) and a *Contacts* manual. You also get three disks (PC system and backup disks and *Contacts*). The documentation has some very frustrating inaccuracies, especially early in the tutorial. It does, however, contain some interesting stuff not generally found in program documentation, such as a general implementation plan for SAVVY PC programmers and database reference books. We expect to see other completed applications to become available over the years besides the *Contacts* database system.

All in all, for the right person and the right system, SAVVY PC is great.

—Barbara E. & John F. McMullen

power-base: A Heartbreaker

From a software reviewer's standpoint, *power-base* is a heartbreaker. It clearly has the potential to become a powerful force in the market, but that potential has not been realized in the product's first release.

The Good News

power-base (PB) is an integrated, menu-driven, relational database management system designed for the end user, as opposed to systems with procedural languages, which are really intended for use by applications designers and programmers.

Files are defined (or created) when you paint an input form on the PC's screen. *PB*'s screen-painting utility is excellent in every important respect—much easier to use than similar utilities found in even the most expensive procedural-language-based systems.

You simply type in screen prompts and then answer *PB*'s questions regarding the related variable. The screen can be rearranged at any time, and visual attributes (brightness, inverse video, and so forth) can be assigned either to prompts or input lines.

Fields are defined by type and size, and editing checks can be defined for each. Once the screen is defined and accepted by the user, *power-base* creates associated data and housekeeping files.

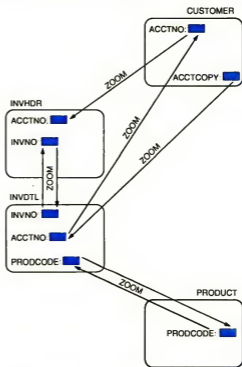

Any number of files can be created, ideally with master/unit (that is, parent/

child) relationships. Finally, links can be established connecting fields in the various files to provide a path for the Datazoom feature.

To understand how the Datazoom feature works, picture, if you will, an invoice system with customer files, part-number files, and order-transaction files. Each customer is represented by a record in the customer file. Each line item in an order is represented by a record in the order-transaction file, and each part is described along with its price and inventory informa-

tion in the part-number file. Assume further that each customer has an identifying number, each order-transaction record has a customer-number field, and each part has a part number that appears in both the order-transaction file and the part-number-file.

Datazoom enables the user to call up a customer, "zoom" to the order-transaction file, and scan part orders from that customer. Users can also "zoom" from an order-transaction record to a part-number record for complete information about the

Connections between files are established quickly with the zoom operation, as is shown in this *power-base* illustration.

power-base

Power-Base Systems, Inc.

12 W. 37 St.

New York, NY 10018

(212) 947-3590

List Price: \$395

Description: Relational

Requires: 230K RAM, 2 disk drives,

DOS 1.1, hard disk recommended.

Records per File: 65,534

CIRCLE 754 ON READER SERVICE CARD

power-base can handle up to ten zoom levels, and the linkages can be set up in various directions from multiple fields. You can see a map of your files and their links on the screen or at the printer.

part. Records can be edited, added, or deleted, at any point in the process.

PB can handle up to ten zoom levels, and the linkages can be set up in various directions from multiple fields. You can see a map of your files and their links on the screen or at the printer.

Every level of activity is fully prompted and the documentation, while excellent, seems almost unnecessary because of the help provided by the thorough on-line prompting.

The menu-driven Datzoom feature enables easy browsing through records, allowing you to examine raw data and the relationships among data.

On-screen fields can be the familiar numeric, alphanumeric, or text types. Additionally, a field on one screen can be the result of a lookup to a linked file, an on-the-fly calculation among fields in several files, or a function (sum, min, max, average) of a subset of fields in linked records.

Retrieval is quick, even among intricately linked files, because of *power-base's* B-tree indexing.

The Bad News

PB's strengths (as seen in the version reviewed here) are on the input side. Its weaknesses are mostly on the output side.

For example, *power-base's* report-writing facility allows only one sort level. While this can be overcome with manual intervention (making selects manually at one level and sorting automatically on the second), it is a considerable limitation in a product designed for serious data manipulation.

The report-writing utility is basically not much more than a listing device. It can output to printer or diskfile, and it provides good support for headers and page control. It also allows subtotals and grand totals on selected numeric fields. However, its page-formatting capability is strictly

limited to list-type structures.

Ironically, the report writer can not produce documents (such as invoices) from multilevel databases, despite the fact that the documentation's excellent tutorial is based on an invoice system.

Success or Failure

The success or failure of *power-base* will ultimately depend on the release of Version 1.1, which is scheduled for July. Version 1.1 is said to include multilevel sorts, a full-feature report writer (and thus page-formatting capability), a label utility, support for fixed-length records, global replace, and global recalculation. The new version will also support import and export of files in DIF, SYLK, SDF, WKS, BASIC, and ASCII formats.

The reviewed version of *power-base* shows all the promise of a real blockbuster. If the manufacturer delivers on its promises for Version 1.1, I could happily recommend this database management system to anyone with a requirement for simple-to-use, ad hoc data retrieval. However, that's a pretty big if.

Version 1.1 should be worth every penny of its \$395 retail price. Without the Version 1.1 improvements, however, *power-base* is nothing but a fancy but grossly overpriced index card system.

PC is watching for Version 1.1 and will report on it as soon as possible. Meanwhile, readers might want to wait for Version 1.1, too. —Richard Aarons

```

This SALVO program, called DEPTSAL2, can be used to print fields from the Employee, Salary, and Department files.

When it comes to database managers for the PC, the buzzword of the day is *relational*. Since the success of *dBASE II*, hardly a day goes by without the emergence of another database manager bearing this magic word. As followers of the "Project: Database" series have discovered, the term *relational* is often applied as frivolously to this software as the term *IBM-compatible* is to some hardware. The situation has gotten so out of hand that I fear that the average user wouldn't recognize and know how to take advantage of a truly relational program even if one were at hand.

The SALVO program system, from Software Automation, Inc., addresses these concerns head on. Not only is the system truly relational, it also makes complete use of the remarkable flexibility of relational data management; it is easier and more intuitive than any other program I have seen. It is fast, flexible, and unique in many aspects. Unlike many other pro-

grams that try (and fail) to meet the needs of both beginners and advanced users, SALVO can truly satisfy the needs of an unusually wide spectrum.

SALVO is an acronym for Software Automation Language VOcabulary. The emphasis on automation is evident throughout the system. Ostensibly designed for nonprogrammers, SALVO has a simple, menu-driven interface and is quite adept at navigating deep waters with only a midshipman at the helm. The documentation is clear and helpful in explaining the concepts necessary to fully utilize the relational model, and on-line help and tutorials are available for further assistance.

Creating a Data File

Defining a data file is straightforward. Choosing the File Maintenance option from SALVO's opening menu brings up a menu that includes the choices Create, Revise, Listable (to change the display characteristics of fields), Erase, Export, Import, or Rename. Selecting Create begins the definition process. Each field has a field name of up to 20 characters, a data type, a length, a key type, a list attribute that indicates whether the field will be displayed in certain circumstances, and a prompt/heading, which is used in some outputs.

The data types available are unusually flexible. They include alpha, byte, integer, numeric, dollars, S.CTS (dollars and cents), decimal, and date. All of these data

types (except alpha) can be used in calculations. You can specify a minimum and maximum value for any numeric type field; the WITHIN and BETWEEN parameters permit inclusive and exclusive range-checking if desired.

The index key definitions available are the first indication that some unusual things are afoot in SALVO. The key types include Nokey (if the field isn't keyed), Primary (for unique keys), Alternate (to "provide an alias identification for each record"), Partial (to combine two partial keys to serve together as a primary key), and Foreign (to identify a record in another file).

Finally, a prompt or heading can be assigned to each field as a label. SALVO uses the field name as a default if you

Not only is SALVO truly relational, but it also makes complete use of the remarkable flexibility that relational database management provides.

Employees and Salaries by Department

As of 06/09/84

Department Name	First Name	Last Name	Current Salary
Accounting	Alex	Marshall	\$15500.00

Marketing	Joshua	Fallon	\$51300.00
Marketing	David	Banning	\$53500.00

This is the report produced by the SALVO program, DEPTSA2.

don't provide an explicit entry. Function keys are used (as they are throughout SALVO) with definitions at the bottom of the screen for help and to perform various functions.

Once the definition is complete, the program checks the schema for validity and compliance with SALVO's rules. Field names must not be used in any other files on the disk you are working with, which sometimes can be a bit of a problem when using a hard disk with many data files. More importantly, at least in the master file, the system requires a unique key, on which other files will be dependent. Some data files lend themselves to this requirement painlessly (a customer file with unique customer numbers, for example), but a bit of tap dancing may be needed to create a unique key for others. You can use various methods to create a suitable key, depending on the nature of the data to be stored. You should give this some advance thought.

Defining a single master file is not terribly different than doing so with other database managers, but defining related files invokes a lovely feature. SALVO handles one-to-one, one-to-many, and many-to-many relationships with a combination of graphic representation and prompting that makes the normally complex concepts easy to understand even for users unfamiliar with relational methods. Three levels of relationships are displayed: higher, cur-

rent, and lower, with the master file as current. A secondary file is first shown above the master file, in the higher position, and you are asked a question that explores the relationship between the two files.

Using the SALESMAN and CUSTOMERS files as examples and assuming that the SALESMAN file has been defined

SALVO requests the key field at the bottom of the screen and checks for unique values before allowing input of the remaining fields.

first, SALVO would ask if "there could be many CUSTOMERS for each SALESMAN and there can be only one SALESMAN for each CUSTOMER." If the answer is yes to both parts of the question, you have established a "one-to-many" relationship between the files. Similar questions would be asked for other types of relationships. As the investigation

proceeds, the graphic representation changes to show the secondary file on the same level or below the master file. Once you match the desired relationship, SALVO automatically structures the interactions correctly, sometimes inserting the correct key field in the schema for the secondary file. This process can continue for as many files as needed, with quite complex relations defined smoothly and almost transparently.

This is exceptionally easy and leads to efficient and highly relational databases that would probably be beyond the definitional capabilities of even rather advanced users. SALVO handles the necessary linkages without the complex programming that would be required in most relational systems (if they can handle such highly linked relations at all).

Data Input

SALVO considers data files to be either active or inactive. An interesting concept is implemented to activate a file. Files can be either extracted from or included into the list of up to 16 active files. If a file is extracted, changes made to the file are not saved unless the file is explicitly saved, while included files are updated as changes are made. This allows you to work with copies of a data file until you are sure changes are accurate. To save time, SALVO can extract or include an entire group of related files—a nice idea.

Entering data uses the REQUEST module, an option on the main menu. REQUEST is used for the natural language input that SALVO can accept. To input information into a CUSTOMER database, you would merely type UPDATE CUSTOMER. Active files are shown in a screen window to indicate which files are available for update.

The entry process itself holds no surprises. The key field is requested at the bottom of the screen, and SALVO checks for unique values before allowing input of the remaining fields in the upper portion of the screen. SALVO immediately rejects

duplicate keys and field values outside any specified limits. Fields are requested vertically down the left margin. Previous records remain on the screen, a design I have long preferred, because it helps you to avoid losing your place when entering lists of data. Extensive use is made of video attributes on a monochrome monitor to make the entry process visually attractive and clear (color displays use color in a limited way for differentiation of prompts and data, but the mono display is far better). Once all the data are added, the program displays all the records that have been input, already sorted into primary key order.

Trade Barriers

My first problem with *SALVO* occurred when I began the process of loading the three PC data files for systems in this class. *SALVO* has EXPORT and IMPORT commands, so I expected no major difficulty. These commands, however, permit only files in the DIF interchange format. Even worse, *SALVO* uses an idiosyncratic DIF formatting method that requires three DIF files to effect a transfer. The first defines the file characteristics, the second the field layout, and the third contains the actual data. The first two can be prepared by creating a matching file spec and using the EXPORT function, then IMPORT is used to bring the foreign data over. I was unable to make the process work using the PC-supplied DIF files. I suspected that these files were not totally correct, but I had no way to check for sure.

Accordingly, I typed 25 records in each data file into *SALVO* by hand. While the *SALVO* timing benchmarks are thus not comparable to some of the competitive products, it did allow me to test the other aspects of the system.

The EXPORT-IMPORT capabilities are clearly one of the weakest aspects of *SALVO* (the only major problem I had with the program, in fact). Software Automation recognizes the problem and promises expanded and improved handling of foreign files in a future release.

Natural Language Requests

Once data have been entered, you can explore the real power of *SALVO*. It has three main methods of accessing and retrieving information: natural language requests, graphic views of the data file relationships, and the *SALVO* programming language.

Some years ago, I worked on an early natural language interface that generated accounting programs. It was somewhat surprising to me how relatively simple a natural language interface could be, provided reasonable restrictions were placed on how natural the language input could be. Even working in the relatively unsophisticated CBASIC, I was impressed with the power of natural language. Since then, I have wondered why more products have not taken advantage of these techniques.

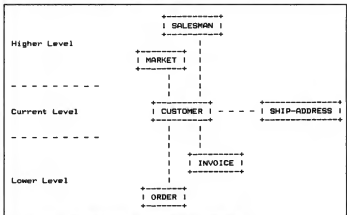

Like any microcomputer natural language system, *SALVO* parses an input line looking for key words it has been programmed to recognize. These include some synonyms for common words, while many connective words are simply ignored. Connectors make the language input seem more natural even if they have no effect. Certain prepositions can be used to change the sense of the request. A few words are forbidden, usually because they

are question-type words that could generate requests beyond the scope of the program.

While the number of words seems a bit limited (especially in the current release), you can formulate some rather complex requests to *SALVO*. A request such as LIST THE RETAIL CUSTOMERS FOR SALESMAN BAKER AND THEIR ORDERS AND PARTS will actually access four separate data files and produce a nicely formatted screen display complete with windowing!

The request must fit on one 78-column line and cannot be edited if an error is made. The output displays *SALVO* creates are very usable. Different request verbs, such as DISPLAY, LIST, GET, and SHOW, produce different report formats, some horizontal and some vertical. They do not include subtotals, grand totals, counts, or other aggregate functions, however.

When a request is entered, *SALVO* actually creates a program in the *SALVO* language and then executes that program. The program is stored in a file named TEMP. After execution (or before if the word VERIFY is included in the request), this program can be examined, modified, and saved in a permanent disk file for repeated execution. The compilation of

SALVO displays file relationships graphically on the screen.

Input Screen Specifications

Method	Capabilities				
	No. screens per file	No. files per screen	Simulate paper forms	Link help messages/prompts to a field	Master/detail relationships

the *SALVO* program takes only a few seconds.

Generating requests and looking at the programs that result is a terrific way to learn the *SALVO* language. The language itself is reasonably straightforward, but modifying request programs makes the operation of the language almost obvious to anyone who has programmed at all. The brevity of the programs generated is a testimony to the power of the *SALVO* language, and simple modifications to the short programs can customize output to almost any degree.

The VIEW Module

Another way of retrieving information is the VIEW module. As I discussed earlier, *SALVO* displays the relational structure of a complex database. Even a six-file system is easy to structure and use.

The VIEW module allows you to request information from any of the files displayed by moving the cursor to a file and hitting R for retrieval. Similarly, updates can be made to any of the displayed files by typing U. When you choose retrieval, *SALVO* builds a natural language request on the screen, which, in turn, is passed to the program generator to create a program for execution. As always, the resulting program can be edited and saved.

The VIEW module uses an interesting "navigation algorithm" to build its natural language request. The system is capable of generating requests across the relational structure, which might not be accepted by a user-input request.

The SALVO Language

SALVO provides a full-screen editor to enter or edit programs. The editor can be invoked directly from a menu, or can be reached after a REQUEST-generated program has been executed or after an error has occurred in a request or program. *SALVO* programs are divided into screens of 14 lines of 72 characters each, but these short programs can be nested and chained together as well. Given the amount of

work that can be done by even a short program, few *SALVO* programs will be long anyway.

The editor uses the cursor movement and function keys to control editing. The editing capabilities are rather limited compared with free-standing editors or word processors, but the *SALVO* editor is usable for short programs. An annoying feature is that it doesn't use the Ins and Del keys on

SALVO has three main methods of accessing and retrieving information: natural language requests, graphic views of the data file relationships, and its programming language.

the IBM keypad, so you'll need to familiarize yourself with it before you can edit smoothly. One nicety is a List/Pick function that displays filenames and field names and allows the programmer to select desired elements with the cursor keys for direct inclusion into the program text.

The language itself is intertwined with *SALVO*'s style of relational data management. It is not a general-purpose language and would not be a good replacement for a normal high-level language (the way some people use *dBASE II*'s language, for example). But as a data manipulation tool it is excellent. The syntax is terse, yet expressive and powerful. You can perform a great deal of useful work with only a few commands. The authors of many such languages claim, as does Software

Automation, that complex application systems can be programmed using their languages in much less time than with COBOL or BASIC. This claim surely stands up for *SALVO*.

Performance

With the short 25-record PC-supplied files, performance of almost all *SALVO* functions was essentially instantaneous. Even reports that accessed all three sample data files simultaneously did not generate any delays. Accessing data was simplicity itself, whether the natural language system or the graphic VIEW module was used. Modifying the resulting *SALVO* language programs was equally easy.

Programming from scratch in *SALVO* took a bit of practice, but this would be the case with any new high-level language. The output programs from REQUEST and VIEW modules were tremendously helpful as learning tools, although some detailed examples in the manual or on disk would have been helpful as well.

Summary

I like *SALVO*. In a time of one look-alike database product after another, *SALVO* has not just one but many unique, fascinating, and useful features. It is difficult for me to evaluate whether *SALVO* is up to truly major program development like complete accounting applications and some of the other serious applications that have been programmed in competitive database managers, but I believe *SALVO* could handle the job.

One appealing aspect is that all this power and flexibility runs smoothly and uneventfully. Some of the large database systems ported down to the PC from minis and mainframes simply overwhelm the limited computing horsepower of the PC. Combined with reasonably good documentation, fine on-line help facilities, good factory support, and a reasonable price, the unique features and good performance of *SALVO* make it worth careful consideration. —Glenn A. Hart

Files (cont'd)

Specification	Things You Can Specify				
Must files be built/modified only from data dictionary?	None	Field data	Tokens, aliases, or synonyms	Index data	Permissions/security
Yes, individual items can be created at any time, added to dictionary, and then used in future file definitions.	—	12 types, including state, phone, and social security numbers. Others are programmable.	Yes, an automatic feature of the adaptive pattern recognition system.	Yes	Yes
Files are updated continuously as data are added or deleted.	—	Alphanumeric, numeric, dollars, logical.	No	Yes, up to 6 fields per file.	No
Yes	—	Yes	No tokens or synonyms. Alias keys are called Alias keys.	No	No
Yes	—	Almost every aspect can be specified, including multi-occurrence indicators, master detail code, left-right justification, and output display conversion.	Yes	Yes, but not dictionary function.	Yes, but not dictionary function.
Yes	—	Yes	Yes, aliases can be used for file names and fields.	Yes, 9 indexes per file. Indexes are updated after each record entry.	Programmable
Yes	—	Yes	Yes	Yes	Yes
Yes	—	Element name, 1 of 11 data types, length of character strings.	Yes	Yes, can add or delete indexes directly, can allow duplicate keys.	No
No, files can be built or modified at any time.	—	String, numeric, and logical.	Yes, can be created through the use of macros.	Yes, any field can be indexed, no limit to the number of active indexes.	Yes, provides extensive security down to field level.
No, but must be using dBASE III.	—	Yes	Programmable	Yes, up to 7 index files per data file.	Programmable

					System
Encryption	Relations	Validity tests	Error or prompting messages	Multiple views of database	Maximum No. Record Types per Database
Yes	Yes	Yes	Yes	Yes	Limited by disk space.
No	Yes	Yes	Yes	Yes	10
No	Yes, primary, alternate, partial, and foreign key types are specified for each field.	Yes, validity of entire data structure is checked when schema is input.	Yes, if data structure is incorrect.	Yes, has excellent system for changing view of overall database structure.	14-16 files at any one time; up to 100 files may be related.
Yes, but not a dictionary function.	Yes, any number of files you wish.	Yes, with an extension to BASIC if needed.	Yes	Yes	Limited by disk space.
No	Yes, pointers are stored in the data dictionary.	Yes, validity testing is done at system level for violations of data dictionary elements and at programming level for routine I/O.	System generates trapable error messages.	Yes	125
Yes	Yes	No	No	Yes, a multisegment file may have alternate viewing points set up at various segment levels.	64
No	Yes	No, done at the form level instead.	No, done at the form level instead.	Yes	Limited by disk space.
Yes, all data files are encrypted automatically. Procedure files can be encrypted.	Yes	Yes	Yes	Yes	Limited by disk space.
No	Yes, with new SET RELATION command.	No	No	No	Unlimited, up to 10 open at one time.

Specifications					Error Handling
Maximum No. Fields per Record	Maximum Record Size	Maximum No. Records per File	Maximum No. Records per Database	Maximum Field Size	
254	1,018 bytes	20,000	204,180,000	255 bytes	Field-by-field, total, and selective prompting.
64	1,600 bytes	65,534	65,534	80 bytes	Field-by-field
16	1,019 bytes	32,000 records or 1 megabyte total file size.	512,000	78 bytes	Field-by-field, total, and selective prompting.
Limited by disk space.	65,530 bytes	Limited by disk space.	Limited by disk space.	65,530 bytes	Programmable
255	4,000 bytes	65,536 bytes	8,192,000	255 bytes	Programmable
250	4,096 bytes	Limited by disk space.	Limited by disk space.	255 bytes	Field-by-field is default; other methods are programmable.
2,048	2,048 bytes	Limited by disk space.	Limited by disk space.	2,048 bytes	Field-by-field and total prompting.
255	65,535 bytes	65,535 bytes	Limited by disk space.	65,535 bytes	Field-by-field, total, and selective prompting.
128	4,000 bytes in datafile, 512 kilobytes in memo text files.	Limited by disk space.	Limited by disk space.	4,000 bytes	Field-by-field and selective prompting.

Data Types and Maximum Sizes

Character	Numeric				Date
	Integer	Floating point	Money or dollars	Other numeric	
255 bytes	63 digits	Range: $\pm 10^{63}$	Yes	No	Programmable
80 bytes	8 bytes	8 bytes	8 bytes	No	Yes
78 bytes	Range: $\pm 9,999$	9 digits	9 digits	Byte type handles from 0 to 225; numeric type handles values $\pm 999,999,999$	Yes, in form MM-DD-YY System date is available
65,530 bytes	14 digits	Range: $\pm 10^{-4032}$	Yes	No	Yes
255 bytes	Range: $\pm 32,767$	No	4 digits	Packed BCD fixed point with 4-decimal-place precision	Yes
255 bytes	9 digits	9 digits in single precision, 15 digits in double precision.	9 digits in single precision, 15 digits in double precision	No	Yes
2,048 bytes	Range: $\pm 32,768$	7 digits in single precision, 14 digits in double precision	Stores internally as double precision floating-point value. Will always be exact to nearest cent.	No	Yes
65,535 bytes	Range: $\pm 32,896$	14 digits	No. is specified with I/O edit mask.	The value of a numeric field determines whether it is integer or floating point.	Yes
254 bytes	No	19 bytes, uses 8087 chip if present	No	No	Yes

Types/Sizes (cont'd)		Demo Version			Data Importing
Time	Logical	Available?	Cost	Limitations	
Programmable	Yes	Yes	\$9.95	20K database	Programmable
No	Yes	No	—	—	Programmable
No, but system time is available.	Yes	Yes	\$49.95	50-record maximum and 5 files open at one time.	DIF format only, with special requirements.
Yes	Programmable	No	—	—	SDF, nondelimited ASCII sequential, dBASE III files, and almost any others with programming. Can also link to another system running Revelation or the PICK operating system.
Yes	Yes	Yes	\$100	25-record maximum	Programmable
No	Programmable	To dealers only	—	—	Fixed format or comma-delimited standard ASCII files and mainframe FOCUS files.
No	No	Yes, included with system.	—	—	Special ASCII delimited, can specify delimiter.
No	Yes	Yes	\$50	15 records	DIF, BASIC, ASCII, and unquoted ASCII
No	Yes	Yes	\$9.95	63-record maximum	SDF and many special delimited formats.

Data Exporting	Advanced Features				
	Back-up-Ability/ Copy Protection	Audit Trails		Data Restructuring	
		Pre/post imaging	Activity or transaction log	Technique (inherent/ separate program)	Adding or changing indexes
Programmable	Yes	Yes	Yes	Commands are inherent, but user must be programmed.	Yes
Programmable	All diskettes except primary "USER" diskette may be backed up.	Yes	No	Inherent	Yes, at any time.
DIF, and standard ASCR, also programmable.	No	No	Programmable	Inherent	No
Same as importing except no dBASE II export.	No	Programmable	Programmable	Accomplished through dictionary update and occasional BASIC program.	Yes, but normally uses direct-access hashing or a "select-list" of keys.
Programmable	Must back up all data files and associated files and run-time modules together.	Programmable	Programmable	Separate	Yes
Fixed format and comma-delimited files. Standard ASCII files, DIF, and 1-2-3 PRN files.	The 11 program diskettes may be copied, but noncopyable "Activator" diskette must be present in Drive A: at boot time.	Programmable	Yes	Inherent	Yes
Special ASCII delimited; can specify delimiter.	Yes. This one is built for real database security.	Yes	No, not needed with full imaging.	Separate	Yes
DIF, BASIC, ASCII or unquoted ASCII; others are programmable.	Yes, in query language mode or within a procedure.	Programmable	Programmable	Inherent	Yes, at any time.
SDF, special delimited formats, and programmable.	Programmable	No	Programmable	Inherent; does not erase all data, but records existing data.	Yes

Adv. Features (cont'd)		Report Generation			
Linked or Multiple Update of Indexes and Files	High-level Language &/or Product Interface	Capabilities			
		Sorting	Aggregates (min., max., count, avg., percent, etc.)	Arithmetic (+, /, *, -)	Parameter passing
Yes	Yes	Unlimited number of sort fields	Yes	Yes	Yes
Yes, this is one of the stronger points of this product.	Yes, to BASIC.	Does not sort, indexes only	Yes	Yes	No
Yes, system can update multiple linked files almost transparently to user.	No	1 sort field	No	No	No
Yes, on any number of files.	Yes, to R/BASIC, a full implementation of compiled BASIC that follows the structure of PICK BASIC with significant language extensions and new features.	Any combination of ascending and descending fields	Direct verbs to sum, count, and do simple averages. More complex formulas can be coded into the data dictionary.	Yes	Yes
Yes	Yes, to Digital Research's Pascal Data/Vex is written in Pascal.	Does not sort, indexes only	Yes	Yes	Yes
No	No	Up to 32 sort fields.	Yes	Yes	Yes
Yes, controlled by multiple screen forms.	Has a comprehensive library of C routines.	Multiple sort fields, ascending and descending. Can even sort on part of a character string.	Yes	Yes	Yes
Programmable	Interfaces with BASIC or products using supported import/export techniques.	Unlimited number of sort fields	Yes, can be treated as memory variables.	Yes, all math and logical operators except exponentiation are supported.	Yes
Yes	Enhanced dBASE programming language	New high-speed, multikey sort	Count, sum, and average, others programmable.	Yes	Yes

		Query Language			
Flexibility of output	Multitask access	Mass additions, deletions & updates	Load and unload	Execute stored scripts	Quality of output
Very flexible	Yes	Yes, via underlying SAVVY language.	Yes	Yes	Good
Excellent with single file, more difficult in master detail relationships	Yes	Mass deletions are supported, mass additions are not	Yes	No, but can use ProKey scripts.	Menu-driven, quite effective
Good, program generates good columnar and other formats	Yes	Yes	No	Yes, using stored SALVO language programs	Quite good
Basic format of reports is columnar, but more elaborate formats are programmable	Yes	No	Yes, but not a query function	Yes	Excellent, but slow at scanning file
Highly flexible but complex	Yes	Can be done from report writer, not from query language	Yes, but usually done by report writer	Yes	"Flex-Key" system uses function keys for select and edit routines
Very flexible	Yes	Yes	Yes	Yes	Fine
Very flexible	Yes	Yes	Yes	Yes	Excellent
Output procedures are complex but flexible	Yes	Yes	Yes	Yes	Excellent
Any output form is programmable	Yes	Yes	Yes	Yes	Good

Report Generation (cont'd)					Procedural Language
Query (cont'd)	Report Formatter/Generator	Screen Dumps	Other	Built-in Applications or Examples	
Other					
No	No	Yes	No	Yes, sample databases on diskette.	Yes, tests are user-defined and are composed of factory-supplied commands.
Query language is English-like. Queries can be made with menus or commands.	Very limited; only lists can be output.	No	No	Yes, including a telephone/address/ personal information log, a stock transaction tracking system, and a project planning system.	No
Natural language queries generate SALVO language program that can be further manipulated.	No, but can be programmed in SALVO language.	No	No	Demonstration files and examples are excellent models.	High-level language provides excellent flexibility for complex data manipulations with advanced relational techniques.
Query can build selected and sorted key lists for use by other query functions or BASIC programs.	Yes, provided in the Application Builder system.	No	No	Yes, sample database used throughout tutorial.	One of the finest implementations of BASIC I've ever seen.
"Flex-Key" system uses function keys for the database select and edit routines.	Highly flexible and complex. It can generate output for any media in any format.	Yes	No	DataFlex comes with several simple business applications.	Powerful, but difficult to learn, because commands are literally a mixture of Pascal, COBOL, and BASIC.
No	The TABLETALK function is a built-in report generator that simplifies report definition.	Yes	Financial modeling features, user-written subroutines.	Yes	The entire system is a procedural language.
Can create temporary files, assign field name synonyms, add/delete index files, set up input prompts.	Yes, the ACE report writer is almost a complete programming language.	Yes	Includes if-then-else logic, subroutines, C interface, full format control.	Yes, package comes with two sample databases.	Does not have a procedural language. If it did, it would be unbeatable.
Uses a superset of IBM's SQL/DS query language.	Yes	Yes	KIMen has built-in spreadsheet. Cells can be used as table fields or memory variables.	Yes, checkbook management system and an investment time-value analysis system.	Quite powerful. Debugging modes are available.
No	Yes	Yes	No	Yes, complete accounting example.	Yes, updated and enhanced version of dBASE II language.

Performance Measurements

Time to Enter Standard Info	Time to Execute Standard Task	Time to Perform Sort	Time to Extract Random Records	Size of Database Created	
				Number of records in employee file	Space compression
Limited by typing speed.	2 minutes, 52 seconds.	5 minutes, 58 seconds using 680 records and 495 employees	1 second	495	Yes
8 minutes to define files and input form; 11 minutes to import 25 records.	25 minutes	Not applicable; program indexes rather than sorts.	1-4 seconds	25	No
Limited by typing speed.	Several minutes	Almost immediate	Almost immediate	25	No
10 minutes	1 hour, 7 minutes.	About 2 minutes for 3-field sort	Almost immediate	500	Yes
Required 4 steps taking a total of 1 hour, 8 minutes.	1 hour	8 minutes	Less than 1 second	500	Yes, on numeric fields.
3 hours to develop instruction the first time, followed by 1 minute to import. Future instruction development would take 10 minutes.	10 minutes	1 minute, 10 seconds.	1 second	500	Yes, space is managed tightly.
1 hour	30 minutes	25-40 seconds, depending on sequencing.	Less than 1 second for indexed access.	640	Defined numerics are compressed, but strings are not.
2 minutes to write the batch routine; 3 minutes, 45 seconds to load all 3 files.	2 hours, 15 minutes.	1 minute, 16 seconds.	1 to 4, unindexed; less than 1 second indexed.	500	Only after records are deleted.
1 minute, 45 seconds.	8 minutes, 30 seconds.	44 seconds	Almost immediate	500	No

Performance Measurements (cont'd)					Hardware/
Size (cont'd)	Number & Size of Ancillary Files	Degradation with Additional Indexes	Time to Create a Standard Report to Screen	Time to Execute a Standard Report to Screen	Minimum Configuration Required
Variable length of fields					
Yes	2 files; 1 with 249 records, 1 with 263.	None	15 minutes	2 minutes, 52 seconds.	64K at reduced speed, 1 drive, SAVVY's own operating system
No	Directory file was 512 bytes. The KEY and MAP files for each database vary in size.	Yes	4 minutes	20 minutes	230K, 2 drives, DOS 1.1. Hard disk recommended
No	None	Uses only primary indexes.	2-3 minutes	Began immediately.	128K, 2 drives, DOS 2.0.
Yes	3 dictionary files of 500 bytes each	None	15-20 seconds	1-2 minutes before printer starts, depending on complexity and sort requirements.	320K, 1 drive, DOS 1.0, 8087 chip.
No	Each program has one or more data files, index files, and field-name files ranging in length from 128 to 52,204 bytes.	Negligible	1 hour and 30 minutes for new user, much less for experienced user	About 15 minutes	100K, 2 drives, DOS 1.0.
No	2 files, 1 with 640 records, 1 with 680	Negligible	2 minutes	2 minutes	512K, 5 megabyte hard disk, DOS 2.0 10-megabyte disk recommended
No	Index files average 20 percent of primary file.	None	Less than 5 minutes	1-1½ minutes	256K, hard disk, DOS 2.0.
No	None needed for query language operations. Each index requires its own file.	Negligible	30 minutes	5 minutes	192K, 1 drive, DOS 1.1. Hard disk recommended
On memo text fields only.	None, unless indexing is used.	Moderate; less than with dBASE II.	5 minutes	7 minutes	256K, 2 drives or 1 drive and hard disk, DOS 2.0.

Software	Subjective Evaluations				
Configuration Used in Testing	Documentation	Program Robustness	Flexibility/ Ease of Use	Would You Buy This One?	Would You Accept It as a Gift?
512K, 2 drives, DOS 2.0.	Very good. Very comprehensive tutorial, but some small errors that may create confusion	Robust	Very flexible, moderately easy to use	Not my first choice	Definitely
440K, 20- megabyte hard disk, DOS 2.0.	Excellent except that invoice system example used in tutorial cannot be printed	Robust	Ease of use excellent Flexibility is limited by constraint of menu-driven format	Definitely for certain canned applications, but only the upcoming Version 1.1	Yes, for canned applications, but only Version 1.1
640K, 2 drives, 35-megabyte hard disk, DOS 2.0.	Well written but no index. On-line help system excellent.	Robust	Excellent	It is an excellent program, but I still prefer Revelation or dBASE III	Yes
640K, 1 drive, DOS 2.1, 8087 chip, 10- megabyte hard disk.	Excellent organization, many examples. A better index would be a big help.	System doesn't crash in normal operation. Access to a real-time debugger is very helpful.	The Application Builder System is powerful, easy, and fun. The real power comes when you shift to R-BASIC.	Yes, even if I had to borrow the money.	Yes
440K, 20-megabyte Tallgrass hard disk, DOS 2.1	Complete, but seems to jump around without giving the user the big picture	Good	The cost of its great flexibility is a high degree of complexity	Yes, if I needed a multi- tasking system or were working in an environment of mixed machines and operating systems	Yes, if had conditions listed at left
640K 10-megabyte hard disk, DOS 2.0	Massive. To understand the documentation completely requires some understanding of computers and databases	Very robust	Extremely flexible, but not easy to master	Yes, if my application required this much functionality or if I were a mainframe FOCUS user	Definitely
640K, hard disk, DOS 2.11.	Text is clear and complete. Diagnostic message content and debug are poor	A mature, well tested product. To break it, you really have to work at it	Very easy to work with, particularly considering the power of the system. Only serious flaw is lack of a procedural language	Yes, for easy manipulation of a complex relational database, Informix is tops	Yes, Informix is great at what it does
448K, 20-megabyte hard disk, DOS 2.0	Excellent for the professional, difficult for a beginner	Fair. The program is tremendously complex, therefore a lot can go wrong	Taking advantage of its great flexibility takes professional care and knowledge	I already have.	Yes, KMan was the only thing on the market that had the flexibility I needed
640K, 2 drives, 35- megabyte hard disk, DOS 2.0	Pre-release documentation better than dBASE III's, but still needs more examples	Seems solid	Excellent ASSIST, a menu-driven aid	Yes, this one or Revelation	Yes

The R/DESIGN main menu selections demonstrate that *Revelation* is an applications development tool, not an end-user's package.

Industrial strength software has finally arrived for your PC. *Revelation* by Cosmos is the most comprehensive and powerful database manager available today. More than just a data management system, *Revelation* includes an integrated application generator, a complete BASIC compiler, network and conversion utilities, and its own editor. While *Revelation* runs on an MS-DOS system, it provides its

Revelation

Cosmos, Inc.
19530 Pacific Hwy. S. #102
Seattle, WA 98188
(206) 824-9942
List Price: \$950

Description: Relational

Requires: 320K RAM, 1 disk drive,
DOS 1.1, 8087 chip.

Records per File: Limited by disk space.

CIRCLE 759 ON READER SERVICE CARD

own operating environment with a unique file structure and command language.

If you are familiar with the PICK operating system (available for many minicomputers), you will recognize *Revelation*. Cosmos has built a PICK lookalike for the PC. It has all of the functional capability of the minicomputer versions and can also execute DOS commands at any time while remaining within the *Revelation* system. You get the best of both, just for the asking.

This system operates in two modes, one for the novice and the other for people who can program. Without coding skills, you can set up a complete application with menus, entry screens, file management, and reports. R/DESIGN is a menu-driven application generator package that walks you through creating a database file, constructing the data dictionary, defining data entry screens, defining report output dis-

plays, customizing standard screens and reports, and building selector menus.

The entire process runs from a ten-item menu that automatically steps you along from one process to the next. It is not as simple as it first seems; some of the concepts are strange to a PICK newcomer. Nonetheless, it works well and puts considerable power at the disposal of a non-technical user.

Although you can create an entire system using R/DESIGN without learning to program, if you stop there, you will miss *Revelation's* real thrill: the chance to work with a system that has data management and file manipulation features more advanced than those of other products in this survey.

Revelation's real thrill is the chance to work with advanced data management and file manipulation features.

Dictionary Terms

The *Revelation* database structure uses variable-length fields grouped into variable-length records. Each data field is just long enough to contain the stored data—no padding. This arrangement produces a dramatic compression of files, compared with any of the better-known database packages that store records as fixed-length strings. Each file in the *Revelation* database has an associated dictionary that can carry over a dozen items of information about each data element. The dictionary is used by the program's query language to control access to each field and the manner in which it will be displayed. To add new elements to a file only requires adding the definition to the dictionary. Since everything is variable in this system, you seldom need to reload the database. In fact, no utility function for that purpose is included in the package. The data dictionary is unique in several ways; it contains all of the relational statements that specify the joining of two or more files, so that using the element name in a query allows you to join them "on the fly," without having to create a third file. If you have ever labored through this process in other packages, you will really appreciate this

feature. All you do is enter a dictionary term that means "find the department number of the current record, look it up in the department name table, then display the matching department name." If that term is labeled DEPNAME, you can list the EMPLOYEE file and see the name of each person's department, just as if it were stored in the employee record. You don't do a join: the system does it for you whenever that term is referenced in a query. One query request can join many files in this manner to produce the requested output, all in one step.

The other unusual feature of the *Revelation* dictionary is its ability to store a complete BASIC program in a dictionary term record. If you call for that term in a query, you are executing a program that will then create the data to be displayed on the report. The program could analyze data in many files and perform multiple computations in order to arrive at the required answer on the output document. This is real power, folks, not just another pretty report writer.

R/LIST

The query processor is called R/LIST, and much of the first volume of the man-

ual is devoted to its use. The query language is simple in structure, but powerful in execution. The primary R/LIST commands are LIST, SORT, SELECT, and SSELECT. Each command references only one file in the database. The balance of the command line consists of field names (dictionary terms) and various operators. The LIST and SORT commands produce output on either the screen or the printer; both may sort the result on multiple fields (both ascending and descending) without creating another file. A typical R/LIST command line might read:

```
LIST EMPLOYEE WITH  
HIRE.DATE >  
'02/01/83' NAME DEPNAME  
JOBTITLE
```

This will print a report showing data drawn from three different files all at once (no intermediate join file is created). Using the dictionary example, DEPNAME specifies the extraction of the proper department name from a table keyed to the department number stored in the employee's record. Similarly, the dictionary term JOBTITLE calls out the text title matching the job code stored in the employee file. These dictionary terms are stored in the dictionary file of EMPLOYEE. R/LIST always looks in the dictionary of the file referenced by the second word in the command line. From this starting point, the system can access each and every file in the database.

Commonly used dictionary terms can be stored once in a master dictionary file, and the R/LIST processor will "path" backward to this default file if a referenced term is not found in the primary dictionary specified in the command line.

The SELECT and SSELECT commands are used to create key-list inverts (an indexing file) that can be passed to a later process. A simple command can select all male employees hired after a certain date, assigned to one of three departments, and place the selected list of keys in alphabetical order by department. Once

CHANGES?

Revelation's Prompt Editor screen designs customized screens.

created, the list may be saved as a file, then recalled (using the GET-LIST command). Once recalled in this manner, the next R/LIST command will use the invert to control access to the data file. While the command LIST EMPLOYEE will list the entire file, the two-line sequence of GET-LIST MALES (built to select SEX='M') followed by LIST EMPLOYEE will skip over the female portion of the file without having to read those records at all. You can create and store as many lists as you wish. Once built, you may modify a list with the system editor or by a BASIC program. In large file applications, a batch script file can be used to build the list files overnight in preparation for month-end reports and other high-volume report requirements.

Active Lists

The list functions greatly enhance the speed of large file access. Remember that unlike other systems that must scan each record during query and then discard the unwanted ones, an active list is a true invert; it directs access to only the records that are wanted. Once you master the technique, report generation becomes much faster. Query commands may be "catalogued" for future use and given a name. Type the name, and the query runs again without your having to rekey the whole line.

The system also includes the R/BASIC compiler. Combining the high readability of COBOL and structured terseness of FORTRAN, this implementation of BASIC is both easy to learn and highly readable. It has none of the strange notations required by CBASIC or MBASIC; you write using meaningful variable names and statement labels, not numbers. The compiler knows the data type of each variable without being told. Nor do you need an advanced degree to perform file operations. The READ and WRITE commands will do, since the data management software will handle the direct access to records and the locations of individual fields in the variable format records.

Icing on the Cake

R/BASIC can access data files without knowing the format of the records in the file. The file dictionary is available to the BASIC program, allowing indirect reference to fields. The system will determine the relative field location, size, format, justification, and required conversions at the instant that the reference is made to the data. You can completely restructure a file, rearrange the fields, change their sizes, and add new fields to a file without rewriting or recompiling the programs!

In addition to its full command vocabulary (including dynamic arrays and string functions), the R/BASIC EXECUTE and PERFORM commands allow you to

R/BASIC allows you to invoke any Revelation or PC-DOS command from within a BASIC program.

invoke any Revelation command or any PC-DOS command from within a BASIC program. This unusual ability is an example of some fresh thinking.

Although I found a number of typos, the Revelation documentation is neatly packaged, nicely typeset, and filled with examples. The two-volume set is broken up for the nontechnical user (Volume 1), and for the programmer (Volume 2). Several lengthy tutorials, strategically placed in the manuals, are a big help to the first-time user. Each tutorial unit contains step-by-step instructions coupled with pictures of the screen in use and explanations of the process that is underway. Since PICK is different from most other operating systems, the tutorials are a definite plus.

Revelation requires a maximum configuration PC to perform its wonders. The

data management software is resource hungry—and the vendor recommends you use at least 512K RAM. The 8087 math coprocessor chip is a requirement. Also, you should recognize that this is a hard disk product, even though it can be run on floppies. The system deals with data files as a series of 64K "frames," and transferring data in that quantity between memory and floppies just doesn't make the grade. You can run Revelation on popular PC-clones including the Compaq, Columbia, Corona, and Eagle computers.

Despite all of the memory and the presence of a math chip, parts of the system are relatively slow in operation. Direct access to any record is very quick, but those functions that call for scanning a file serially are not as fast. Any PICK system carries a serious amount of overhead to support the functions that you take for granted after a short while. What you notice is the sorry effect of a 4.7 MHz CPU coupled with a less-than-rapid disk controller. Remember, that simple query you key in may cause simultaneous access to three or four files plus a sorted key list. All that processing is going on behind the screen, and the PC isn't powerful enough to keep up with the demands for resources some of the time.

Switching to another brand of external hard disk can result in a visible increase in speed. Now if someone would just wind up the clock on the CPU. . . .

At \$950 a copy, Revelation is at the high end of the price range. Couple that with the cost of expanded memory, a math chip, and possibly an external hard disk and you are looking at a sizeable investment before entering the first screen. But Revelation is a classic case of "you get what you pay for." It costs a bit more than most, but it gives you the best there is.

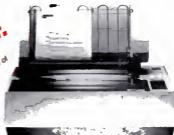

I've worked with mainframes and large minicomputers for many years, and, with the arrival of Revelation, microcomputers have caught up to the larger systems. Yes sir, industrial strength software for the PC has finally arrived!—John Phillips
(continued)

"PRIMAGES...DARES TO DEFY THE COMMON WISDOM BY OFFERING A PRINTER BOTH FASTER AND LESS EXPENSIVE THAN ITS COUNTERPARTS, WITHOUT SACRIFICING QUALITY."

DIGITAL REVIEW,* May 1984

10 MILLION CHARACTERS FREE!
When you buy a Primage I Printer.

* Offer good for 4 free daisy wheels and 42 free ribbon cartridges with purchase of each Primage I printer. Retain value \$300.00. Expires 11/30/84

In today's market, if you're going to defy the common wisdom, you'd better have an uncommon product.

Like the Primage I daisy wheel printer. Uncommon in that it prints letter quality manuscripts at a brisk 45 cps in multiple languages. Interfaces easily with all leading micros and PCs and utilizes patented new technology to improve reliability. Yet it costs less than printers with less capability.

And it helps to have an uncommon sheet feeder to make full use of the printer's speed. Like our PAGEMATE I, a jam-free, trouble-free sheet feeder. Designed as an integral part of the Primage I system, it too is revolutionary in design when compared to other sheet feeders. Yet it costs about half as much as they do.

Stop in at your local dealer for a demonstration of our remarkable system.

You'll be uncommonly surprised.

**PRIMAGES
INC.**

PC NETWORK

... WITH THESE 15 UNIQUE BENEFITS

1 COST+ 8% PRICING—The NETWORK purchases millions of dollars in merchandise each month. You benefit in receiving the lowest price available and all at just 8% above published dealer wholesale price.

2 OUR 400 PAGE WHOLESALE CATALOG—Members receive our 400 page wholesale catalog containing over 20,000 hardware and software products for the IBM PC, APPLE and over 50 other popular computer systems. The NETWORK'S CATALOG IS THE LARGEST SINGLE COMPILATION OF PERSONAL COMPUTER PRODUCTS AVAILABLE TODAY.

3 EXPERIENCED CONSULTANTS—The NETWORK hires consultants to assist you in making a qualified selection. Our consulting staff possess in excess of 150 years of personal computer product experience. We back our consultants with our money back guarantee: IF ANY PRODUCT RECOMMENDED BY OUR CONSULTING STAFF FAILS TO PERFORM AS PROMISED—OR IS INCOMPATIBLE WITH YOUR SYSTEM—WE WILL TAKE IT BACK AT OUR EXPENSE FOR A 100% REFUND.

4 IN-STOCK INSURED FAST HOME DELIVERY—The NETWORK maintains a giant multi-million dollar inventory of most popular products, allowing us to ship many orders from stock. Non-stock items are typically maintained in local warehouses just days away from The NETWORK and YOU. We pay all insurance expenses on your shipment. EMERGENCY OVERNIGHT SERVICE IS AVAILABLE ON REQUEST.

5 FREE TECHNICAL SUPPORT—The NETWORK supports every product it sells. We maintain a qualified technical support staff to help you assemble your system. Interpret vendor documentation and get your software and hardware to work. WE WILL GIVE YOU ALL THE HELP YOU NEED, WHEN YOU NEED IT—FREE!

16 OPTIONAL BUSINESS RENTAL LIBRARY—An option on our BUSINESS RENTAL LIBRARY for just \$25 PER YEAR above the base membership fee. This entitles you to rent business software AT JUST 20% OF THE DISCOUNTED PRICE FOR A 12 DAY PERIOD. If you decide to keep the software, the entire rental fee is deducted from the purchase price. VISA MEMBERS GET A FULL \$15 OFF AND \$30 above the VISA base fee. This also includes the game library privileges for a \$5 combination savings.

17 OPTIONAL GAME SOFTWARE RENTAL LIBRARY—The Game Rental library is available to members for just \$19 PER YEAR and permits evaluation (or just enjoyment) of any game or educational software product as above.

8 SPECIAL SAVINGS BULLETINS—THE PRINTOUT—The NETWORK seeks every opportunity to save money for its members. We buy excess dealer inventories, and store bankruptcy closeouts regularly. We then turn around and make the merchandise (only top quality name brand products) available to our members at fantastic savings via THE PRINTOUT, our newsletter and savings bulletins.

9 DISCOUNT BOOK LIBRARY—Working with numerous publishers and distributors, The NETWORK has assembled a library of over 1000 computer related books and manuals at savings of up to 75% from the normal store price.

10 MEMBERSHIP REFERRAL BONUS—Our most valuable source of new members is you! To date almost 40% of our members have been referred by word of mouth from other satisfied members. For those of you who refer new members, The NETWORK will credit a cash bonus to your account applicable to any future purchases.

11 CORPORATE ACCOUNT PROGRAM—Almost 50% of THE NETWORK'S members are corporate buyers and users (see separate page left). The NETWORK can establish open accounts and assign designated account managers to expedite orders, and coordinate multiple location shipments.

12 QUANTITY DISCOUNTS—For large corporations, clubs, and repeat or quantity buyers, The NETWORK can extend additional single order discounts, when available to us from our manufacturers and distributors.

13 PRICE PROTECTION—The PC industry is crazy! Prices change not yearly or monthly or even weekly but often day by day! These changes are sometimes up but are mostly down! THE NETWORK GUARANTEES THAT IN THE EVENT OF A PRODUCT PRICE REDUCTION, BETWEEN THE TIME YOU PLACE YOUR ORDER AND THE TIME THE PRODUCT SHIPS YOU WILL ONLY PAY THE LOWER AMOUNT! And remember, for Clients who pay by Credit Card, we never charge your card until the product ships.

14 MEMBERSHIP SATISFACTION GUARANTEE—If for any reason you are not satisfied with your membership within 30 days, we will refund your dues IN FULL.

15 PRODUCT SATISFACTION GUARANTEE—If you are not satisfied, for any reason with any hardware component purchased from THE NETWORK within 10 days of receipt, we will refund your entire purchase (less shipping) with no questions asked.

QUENTIN

QUENTIN! DESIGN WITH THE USER IN MIND...

Quality, Reliability, Value...Compatibility

QUENTIN Winchester Disk Drives and Streamer Tape Backup Systems (Q-700, Q-500, and Q-400) were all designed to provide the Apple, Franklin, and IBM-PC user with reliable and flexible mass storage systems.

QUENTIN gives you a choice. Go with up to 20 MB of hard disk, the Q-500, add a streamer tape backup, the Q-400, now or later. Or, you can go with both capabilities built into one convenient unit, the Q-700.

QUENTIN gives you 100% software compatibility with all popular operating

systems for the Apple and IBM-PC, plus high speed, high quality performance through extremely fast Direct Memory Access.

QUENTIN's easy to use features and advanced software engineering allows the system to grow with your needs.

QUENTIN systems' bottom line is simple and straightforward... quiet quality, reliability, and high performance at a reasonable price... QUENTIN!

For more information see your local computer dealer. Or, phone or write QuentIn.

DataFlex: Programming Gymnastics

DataFlex is a flexible, powerful, and complex applications development system. Its advantage is primarily in the broad spectrum of operating systems and machines it supports—both 8- and 16-bit machines and single and multi-user operating systems.

Its major drawback is its complexity. DataFlex is not a program for beginners, but rather a complex and powerful system designed to help professional applications programmers streamline their database operations.

DataFlex was originally written by Data Access Corporation, an applications programming house, for use in its own programming. The package's adaptability to many machines and operating systems is in large part due to the fact that it was written in Digital Research Inc.'s MT+ Pascal language.

At first glance, DataFlex seems to be composed of a hodgepodge of approaches to data management and applications programming. However, when you break its features down into their components, DataFlex reveals itself to be a rational database management system.

Functionally, DataFlex can be divided into two major areas of operation: configuration programming and execution.

In configuration programming operations, you can design applications, define databases, design and configure screens, and design and configure reports, all of which can then be easily used by nonpro-

```
FOR timer FROM 1 to 500
  MOVE timer TO an_integer
LOOP
```

DataFlex's structured control commands include a FOR-FROM-TO-LOOP command that allows for repetition of a task over a specified range.

```
#COMMAND SIGNON
  CLEARSCREEN
  SHOW
  SHOW '          EXAMPLE PROGRAM'
  SHOW ' (C) 1983 DATA ACCESS CORP'
  SHOW
#ENDCOMMAND
```

DataFlex macros can create new commands such as this SIGNON command.

grammers.

In execution operations, you can enter data, perform file maintenance, direct file processing, order report and form printing, query file data, and manage extensive backup operations.

Data Dictionaries

As with most programs of this class the heart of DataFlex is its file-handling routines. Unlike most, DataFlex uses data dictionaries to maintain file specifications. Two DataFlex utilities, AUTODEF and FILEDEF, maintain these data dictionaries. You use AUTODEF and FILEDEF to paint screens and create file structures and relations. You use AUTODEF for DataFlex programs with a single file and FILEDEF for complex, multifile database programs.

Because DataFlex uses data dictionaries, when making changes to a database structure, you must save existing data to a file while redefining (and recompiling) the target file structure. Old data can then be read back into the new file.

Similarly, gross file manipulation (for example, deletions of entire files or databases) must be made from within the DataFlex environment in order to keep the data dictionary files up to date.

Database searches (and, indeed, database sorts) are based on indexing rather than record manipulation. In 16-bit environments, each data file can have up to nine on-line indexes and one ad hoc index. An index (or key) file can have a single

DataFlex's major drawback is its complexity. It is not a program for beginners.

key or multiple keys.

DataFlex's multikey, on-line ISAM (indexed sequential access method) capability keeps each index of each file current with every record entry or deletion. It maintains in a data dictionary basic file structures along with relational links. A REINDEX utility is available if you want to start over from scratch or recover damaged index files.

A QUERY utility enables you to do quick general lookups and scans within the files of a database. The utility uses menus

and prompts to define the search parameters. Unlike the query utilities of some database management systems, *DataFlex*'s QUERY utility is relatively simple and does not allow major changes (mass adds and deletes) to files. Instead, operations of that type are handled by *DataFlex*'s highly flexible but also quite complex REPORT utility.

Program logic is controlled by *DataFlex*'s structured programming language, a curious but effective mix of COBOL, BASIC, and Pascal statements.

This control logic includes the commands GOTO, GOSUB, ON, MODE, and IFNOT.

The *DataFlex* programming environment allows up to 32,000 variables, 40 of which can be of the integer type. Each program can have up to 32,000 lines, and a chaining command is available to link multiple program segments.

In a 16-bit environment, each *DataFlex* program can control up to 125 files with at least 10 files open simultaneously.

As is the case with similar applications development systems, a *DataFlex* program controls all input/output, including screen and file management as well as report generation.

DataFlex source programs can be written on any line editor (a simple line editor is included with the package). The source program is then compiled by the *DataFlex* COMP utility into *DataFlex* pseudo-code. Not only does the compiled *DataFlex* program run faster than it would if interpreted line by line at run-time, but the compiling process, by definition, encrypts the *DataFlex* program, ensuring complete program security.

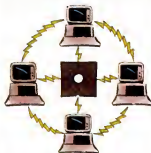

Macro Flexibility

DataFlex is written in the Pascal language, and all *DataFlex* commands are macros that are kept in a macro library accessible to you. This arrangement means that you can enhance *DataFlex* by rewriting *DataFlex* command macros or by designing your own and adding them to the macro library. You can also link *Data-*

Flex with your own Pascal routines.

Macro use is important throughout *DataFlex*. You can always write source code to make any operation occur. But this "brute force" is generally not necessary. Not only can you write macros, but most common activities can be invoked using prestored *DataFlex* macros, which saves a great deal of your programming time.

Although *DataFlex* does not directly support any of the standard export formats (DIF, SEG, or the like), its REPORT writ-

DataFlex is ideal for the large company seeking to standardize database management on a variety of machines and operating systems.

ing utility is powerful enough to allow you to program output in any format you wish.

Import files must be structured in straight ASCII format before *DataFlex*'s READ utility can handle them.

Obviously screens can be used for input and output. A strong feature is *DataFlex*'s

ability to break screens down into images (called pages) that can be used to generate forms with or without data.

With 125 screens permitted per program, 255 characters per field, 255 fields per record, and 65,536 records per file, you will probably never run up against *DataFlex*'s internal limits.

An important feature of the *DataFlex* system is the use of Flex-Keys for routine screen I/O and file management. Basically, *DataFlex* assigns common database management commands to function (and other special) keys. Commands assigned to Flex-Keys can accomplish the following functions: clear screen, delete record, back field, find, help, next record, previous record, save record, "super find," and various user-defined commands. (The "super find" command [SFIND] is a useful feature that searches through successive levels of records.)

These keys all have associated "indicators" that can be used in *DataFlex* program commands to invoke their effects. For example, the SUPERFIND Flex-Key has an associated indicator called "KEY.SFIND" that can be inserted within a program to execute the SFIND command.

Flex-Keys permit you to use common database maintenance commands without the tedium of paging through menus. Because the Flex-Keys always represent the same commands, a program operator can use the same keying routines for all applications designed with *DataFlex*.

These features can reduce programming and training time. In theory, a data entry person working with *DataFlex* programs need only be trained with one set of key assignments. Because all *DataFlex* applications use the same macro keys, there will be no confusion between commands for different applications.

If you do want to create menus, *DataFlex*'s menu development system allows you to create not only complex menu systems for a particular application, but also menu overlays for utility functions that are program independent and can be manipu-

lated to do just about anything you want.

A Supportive Program

As I discussed earlier, one of *DataFlex*'s best features is the wide range of operating systems and processors it supports. Among the microprocessors supported are the 8080, Z-80, 8085, 8086, 8088, and 8186.

The range of operating systems that *DataFlex* supports includes CP/M, CP/M 86, MP/M 86, MS-DOS, PC-DOS, TurboDOS, Novell ShareNet, PC-NET, DMS Hi-net, Molecular N-Star, TeleVideo MmmOST, Action DPC/OS, Omninet, OSM Muse, and IBM PC with a Corvus hard disk.

The package also supports all popular ANSI terminals. In fact, if you use *DataFlex* on the IBM PC with DOS 2.0, you have to set the ANSI.SYS device in the CONFIG file. (When using DOS 1.1, the DOS TERM program is used.)

Obviously, *DataFlex* is designed to operate in a multi-user environment. By "multi-user," *DataFlex*'s designers mean multiple users can write to the same record in the same file simultaneously.

Many multi-user products prevent a record from being read when the record or one of its relatives (a transaction record, for example) is already being accessed by another user. *DataFlex*, on the other hand, allows unlimited read access to the database and then rereads the data when an operator saves a changed record. The record or system is locked only during the SAVE operation itself.

You can, however, elect to use the LOCK command, which will prevent other users from accessing the record while you are processing. This enables you to finish updates to the database before other users post transactions.

DataFlex is a solid product, ideal for the large company seeking to standardize database management on a variety of machines and operating systems or for the professional applications developer.

—Richard N. Aarons

PC/FOCUS: The Price of Power

SEGMENTS INPUT= 498 UPDATED= 0 DELETED= 0
>

```

A procedure, MYSET, was written with *PC/FOCUS* to find and print rejected records and to print record counts.

P*C/FOCUS* is a database management system adapted from mainframes that has just about everything: it maintains huge records (250 fields, 4,096 characters) in files that are limited only by the capacity of your disk drives; it has a very powerful menu-driven report generator; it has built-in graphics, statistics, and communications (both asynchronous and 3270) capabilities; it has an easy-to-use menu-driven procedure to create simple relational and hierarchical files; yet it has the power to design much more complex files. Furthermore, *PC/FOCUS* is based on a powerful procedural language that contains a built-in editor (*TED*), and it can write files out in DIF or Lotus' .PRN formats.

So where's the catch? It's the "price" you have to pay for all these features. By price, we mean more than the \$1,595 cost of the system. To use *PC/FOCUS*, a 512K system with a 10-megabyte hard disk is required. The developer of the soft-

ware, Information Builders, Inc., claims a 5-megabyte disk is enough, but we feel that 10 megabytes is necessary for meaningful work. While this configuration is certainly expensive, it's still not the most significant portion of *PC/FOCUS*' cost. The heaviest expenditure required by *PC/FOCUS* is the time that must be committed to become proficient with the system. To get your money's worth, you must have some understanding of database management theory, not to mention knowing the concepts behind stored programs and computers in general.

Harnessing the raw power of this system can turn out to be real work. Statements in the documentation such as "This option is analogous to the CMS and TSO syntax of DISP MOD to determine the disposition of the file's record" make it perfectly clear that *PC/FOCUS* is not for the uninitiated. Acquiring the understanding demanded by this program is time-consuming and requires a remarkable degree of dedication.

A Mainframe Transplant

FOCUS, in its mainframe implementation, is a system comparable in power and magnitude to the well-known ADABAS, IMS, and IDMS database systems. Its implementation on the PC has not significantly degraded its quality, but the process has imposed some quantity limitations that were not present on the parent product. For example, *PC/FOCUS* has a maximum of 250 fields per record while there is

PC/FOCUS

Information Builders, Inc.

1250 Broadway
New York, NY 10001

List Price: \$1,595

Description: Hierarchical

Requires: 512K RAM, 5-megabyte
hard disk (10-megabyte hard disk
recommended), DOS 2.0.

Records per File: Limited by disk space.

CIRCLE 756 ON READER SERVICE CARD

no limit on the number of fields in *FOCUS*. The maximum record size in *PC/FOCUS* is 4,096 bytes; in *FOCUS* it is 12,288. Despite these limitations, though, the power and functionality that has been put into this system, which comes on 11 floppy diskettes, is quite extraordinary.

To get a sense of how the system works, we converted three existing disk files to *PC/FOCUS* format and performed various activities with the files. A look at these activities shows some of the complexity and power of *PC/FOCUS*.

The first thing we did was define the *PC/FOCUS* files to be processed by the system. We accomplished this in two ways. First, we used *TED*, the system's built-in editor, to create a Data Dictionary file. This works quite satisfactorily. Any other editor (such as *EDIX* or the IBM *Personal Editor*) that writes standard DOS text files may also be used.

Questions and Answers

As an alternative, we attempted to generate the Data Dictionary file using the built-in *FILETALK* utility, which works through an interactive series of questions and answers. Using this method, we generated a Data Directory for the file that we named *G3PERSON*.

The next step was the generation of a *PC/FOCUS* procedure file (called *FOCEXEC* files) to automatically read the data on the non-*FOCUS* file *G3PERSON.SDF* and use it to update the new *PC/FOCUS* file. The file, which must have the suffix *FEX*, may be developed using *TED* or any other DOS editor and will contain the *PC/FOCUS* commands necessary to define the external non-*FOCUS* file and to properly update the new file. We wrote a series of commands to perform this task. We stored the commands in the *MYSET.FEX* file and executed them using the *PC/FOCUS* command *EX MYSET*. The result of the conversion indicated that two records were rejected due to duplicate employee numbers. A file status, obtained by using the

?FILE G3PERSON command, indicates the size of the file and gives pertinent update data.

We produced a report of all employees in last-name sequence with the built-in *TABLETALK* utility. This utility is similar to the *FILETALK* utility in that it uses a series of questions and answers to generate the *PC/FOCUS* commands necessary to produce the desired report.

We then decided to perform a quick analysis of employee distribution by state. This was accomplished very rapidly by entering a four-line *TABLE* command.

Finally, we set up a procedure that selected from the file all employees from a specific state (specified by the user in response to a screen prompt) and performed an analysis of distribution by city. A set of commands was stored in the *TSELECT.FEX* file to produce a screen prompt and report.

We also ran through many more tests, including file joining (not a difficult task in *PC/FOCUS*) and generating various sorts, selections, and reports. In every case, we followed procedures similar to the exam-

ples described above. The system performs tasks very rapidly and it can support the 8087 math coprocessor.

The Experience

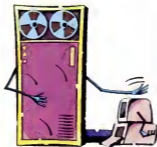

The experience of using *PC/FOCUS* is both liberating and intimidating. The documentation consists of two books containing well over 1,000 pages. The larger of the books, *PC/FOCUS Users Manual*, has a 64-page index and an Appendix of Error Messages that is 30 pages long—in very small print. Users with a data processing background or extensive experience on other software systems featuring user command language capability, such as *dBASE II*, should be able to overcome this intimidation factor, however. And it's worth it, because outlasting the intimidation opens up power and flexibility not usually associated with a database management system. For example, *PC/FOCUS* can turn reports into graphics using the *GRAPH* command. In addition, a full Financial Modeling Language is built into *PC/FOCUS*. The Statistics section can perform all of the standard statistical functions, including cross tabulations and various types of regressions. Users can also design a macro language (called a "User Structured Language" in the documentation) with the *LET* command.

Value

The value of *PC/FOCUS* is directly related to the complexity of the tasks you have planned for it. Thus, the question of whether the system is worth its "price" depends on the degree of your familiarity with mainframe *FOCUS*, the depth of your experience with application development on micros, and the extent of your database management needs. For individuals with the proper combinations of skills and requirements, *PC/FOCUS* could be a wise choice. On the other hand, it would obviously be a waste of effort to go to the trouble to learn *PC/FOCUS* from scratch just to use it as a mailing list manager.

—Barbara E. and John F. McMullen

(continued)

The experience of using *PC/FOCUS* is both liberating and intimidating.

PROFITABILITY

IT's ups for the bottom line. Bank on IT.

The IT series: integrated software that starts with KeepIT, for data base management, and interfaces to other PC-based software and the IT series programs.

The IT series advances the state of the art—to turn your desktop computer into a complete information center. From AskIT, an intelligent interface to KeepIT. To SwapIT, for memory partitioning and instant windowing.

Tektronix 40XX Terminal Emulation

EMU-TEK™ IS NOW AVAILABLE FOR IBM PC, XT, AND MOST COMPATIBLES

- Access powerful mainframe graphics using:
 - PLOT 10 (trademark of TEKTRONIX, Inc.)
 - DISSPLA (registered trademark of ISSCO)
 - SAS/GRAPH (trademark of SAS INSTITUTE, Inc.)
 - DARC (available from QUESTEL, Inc.)
 - and most similar packages and services.
- Upgrade from dim storage tubes to bright raster scan technology, with complete software compatibility.
- Increase versatility with options such as:
 - High resolution board support (HERCULES, etc.)
 - Local pen-plotter support (HP, AMDEK, etc.)
 - Hard copy on EPSON or IBM matrix printer
 - LIGHT PEN for graphic input
 - Advanced communications program features
 - Other terminal emulations, including:
 - VT100 (trademark Digital Equipment Corp.)
 - ADM3 (trademark Lear Siegler, Inc.)
 - RETRO-GRAPHICS (trademark Digital Engineering, Inc.)
- **\$395.00 PLUS OPTIONS**
- **30 DAY NO-RISK TRIAL PRIVILEGE.**

Call or write us, or see your participating dealer.

DATA SYSTEMS

FTG will soon become PC INNOVATIONS

10801 Dale St./P.O. Box 615
Stanton, CA 90680
(714) 995-3900

THE LIGHT PEN FOR YOUR PC IS NOW EVEN BETTER!

- New photo-optical push-tip switch for super reliability.
- **30 DAY NO-RISK TRIAL PRIVILEGE**, and **TWO** year limited warranty.
- Ideal keyboard alternative for INTERACTIVE GRAPHICS, MENU SELECTION, EDUCATIONAL PROGRAMS, and just plain fun.
- Compatible with a growing library of software:
 - PC-DRAW (trademark of MICROGRAFX)
 - MICRO-CAD (trademark of COMPUTER AIDED DESIGN)
 - SARGON 3.0 (trademark of HAYDEN PUBLISHING)
 - and much much more. (Complete list on request).
- Very high performance and reliability for just \$195.00. (Optional three diskette software package is just \$39.00).
- Ultra-deluxe version soon available (\$295.00).
- Got another pen?? Ask about our trade-in special.

CIRCLE 250 ON READER SERVICE CARD

PYXEL Presentations! Maximum Quality . . . Minimum Effort

PYXEL Visuals lets you create screens with text in 4 character sizes (1/4" to 1" high) and drawn lines. Reposition any part of the screen with cursor controls. Fully interactive design and edit capabilities. Print horizontally or vertically.

There are no commands (not one!) to learn — or forget! You select the action with the function keys and manipulate the image you see on screen. It's easy — and fast.

Our new BATCHPRINT utility (used for the headline of this ad) lets you print PYXEL Visuals screens in the highest possible resolution on an EPSON or IBM Graphics printer. Create and edit a list of screens (SHOWTIME compatible) then print them while you get a cup of coffee.

The SHOWTIME utility, included with PYXEL Visuals, lets you link screens together and create a free-running show. You choose the time between screen changes. Or use prompt mode to step forward to each screen or go back to a previous screen.

Requires: IBM PC with PC-DOS, 128K RAM, Color/Graphics Adapter, Graphics Monitor, EPSON with graphics or IBM Graphics Printer. Powerline 8010 version available. DOS 2.0 and XT compatible.

informix: Startling Power

Informix is a startling product. It is not another dBASE II lookalike; it is big, powerful, and amazingly fast. It is also easy to use.

The *informix* system has been around for a while, as you can tell from its version number, 3.11. Over 10,000 copies have been licensed by Relational Database Systems (RDS) since its introduction in early 1981. The system is written in C and was originally developed for the UNIX world. It is available on a large number of CPUs running UNIX, XENIX, and other similar operating systems and has now been ported over to the PC.

Therefore, although *informix* is new to the PC, it is thoroughly matured and debugged. Don't let the lack of a typeset manual mislead you. *informix* is solid as a rock, faster than a speeding bullet, and even leaps over tall buildings on occasion. Officials at RDS tell me that the documentation is being upgraded and that the system is being repackaged for the PC marketplace. I have seen a sample of the new materials, and they are quite nice. In the meantime, Version 3.11 is delivered with a UNIX-based looseleaf manual and an insert explaining the differences between what you see in the manual and what you get. What you get is great, and you can live with those few items that have been altered or deleted in the PC version. Most deletions reflect the single-user PC environment, while the rest result from differences between UNIX and MS-DOS.

informix, Version 3.11

Relational Database Systems, Inc.
2471 E. Bayshore Rd. #600
Palo Alto, CA 94303
(415) 424-1300

List Price: \$795

Description: Relational

Requires: 256K RAM, hard disk, DOS 2.0.

Records per File: Limited by disk space

CIRCLE 760 ON READER SERVICE CARD

```
alias cst = customer;
print customer where salary + cst.salary > 40000
joining co_app = cst.cust_num;
```

In *informix*'s INFORMER query language, the programmer can use arithmetic expressions, do joins on the fly, and print the results.

```
% cat itemrep2

database stores end

define
  param[1] selectitem type character length 20
  param[2] selectquantity type integer
end

read
  into x
  all of orders
  where item = selectitem
  and quantity > selectquantity
end

format every record end

% acego -q itemrep2 File 2
```

oname	item	quantity
Hart, W.	File	3
Court, S.	File	5

Parameters param [1] and param [2] are defined in this example of *informix*'s ACE relational report writer program, then specified as 'File' and '2', respectively, on the command line '% acego' at run time. This narrows the selection to those records with an item equal to 'File' and a quantity greater than 2.

I have worked quite extensively with *informix* on the Altos 586/XENIX multi-user system, which has large files, lots of indexes, many users, and many screens. It was amazing to load up the PC disks (three of them) and see the exact same system appear on my screen. What is really impressive is the speed with which *informix* moves through the database. The Altos system I use is clocked at 10 mHz, almost 2.5 times the speed of an XT. While the DOS version of *informix* is slower in execution than the Altos/XENIX

one, the difference on my sample files is not that great. (RDS supplies benchmark times on files of 20,000 records.) As long as you work within the framework of functions addressed by the system, you will be pleased from the first minute with the ease of starting up *informix* and its speed in execution. The product does need improvement in a few areas, but I'd like to look first at its overall structure. *informix* comes in pieces; you use each piece to perform one function, which helps to keep you going in the right direction.

THE NEWS
WEEKLY FOR
IBM SYSTEM
MICRO
COMPUTERS

The first weekly newspaper designed to
give key executives the latest
IBM Personal Computer news and analyses—
as soon as it happens!

To keep your company in the forefront of today's rapidly changing IBM Personal Computer technology, you need timely information. Information that's clearly written, bringing you the news the way you need it, when you need it. You need PC WEEK.

PC WEEK is the first and only weekly newspaper devoted to IBM Personal Computer news—with the latest breaking stories as they develop.

PC WEEK follows and reports the news—up to 48 hours before publication—so you learn what's new *when it's new!* You'll find research updates, strategic analysis, new hardware and software reviews, insights on future industry concerns and controversies, and the timely information you need to help make you more productive and efficient.

Every week you'll find outstanding features and departments covering...

- **NEWS:** PC WEEK brings you analytical reports on the major topics of the day. Product announcements and

company changes are analyzed and put into perspective, helping you plan for future investments and developments.

- **STRATEGIES:** Every week you get an in-depth profile of a leading user company and how they use their IBM and compatible personal computers. Case studies help you evaluate the success and failure of new applications—some you even may have been considering.
- **INDUSTRY TRENDS:** Discover what's happening behind the scenes in new product development from both hardware and software manufacturers and what this could mean to the future of your company.
- **PRODUCT REVIEWS:** In-depth reviews of important new hardware and software releases tell you what product is right for your operation, and the technical and financial considerations involved.

- **FOCUS ON:** The latest news and events in specific product areas are detailed every week. We cover file systems, 3270 products, graphics software, input hardware, database managers, program generators, multifunctional applications—the information you need for your IBM installation.

- **BUYERS GUIDES:** Special sections with careful evaluations and comparative charts to help you select the proper peripherals and software packages for your operation. From word processing to local area networks or compatibles, you'll find complete and unbiased reviews and listings.

Your subscription to PC WEEK is complimentary if you qualify. Take a moment, fill out the Qualification Form at right and return it to PC WEEK today.

PC WEEK, your vehicle to stay in the forefront of tomorrow's IBM Personal Computer technology.

Get the news you need every week, *first hand*, with PC WEEK.

Complimentary Subscription Application

YOU MUST ANSWER ALL QUESTIONS TO QUALIFY.

1. ☐ Please accept my request for a complimentary subscription to PC WEEK.

2. ☐ No, I do not want to receive PC WEEK.

More PC Enhancements

ACP Key Values for your
IBM PC™ and compatible computers

• The Only PC Intelligent Modem that allows you to switch from Voice to data Communications.

Most MODEMS will let your computer talk. The Bocomp 1200 Baud MODEM allows you to transfer files and verify via telephone that they were properly received. You just plug your regular telephone handset into the back of your IBM PC/XT™.

PC Intellimodem 1200 \$439.00

• 10M Byte Hard Disk for the IBM PC.

Now you can add 50% more capacity than the XT™. Just plug it in and it is ready to run. It is compatible to both the PC and the XT. Comes complete with controller card, data cable and internal mounting hardware. Requires no special software and will boot directly under DOS 2.0.™

Internal 10M Byte Hard Disk with Controller \$995.00

• DYNAFRAME Hard Disk with Back-up Option and Expansion Slots.

The DYNAFRAME by Vista is the ultimate add-on device for the IBM PC. If you are ready to add Hard disk to your IBM PC this is the optimum solution. We are offering the minimum configuration which consists of the DYNAFRAME IBM PC matching chassis, 10M bytes of Hard Disk and Controller, 130 watt switching power supply, and eight slots of expansion capability. If you desire back-up can be added later, either the Syquest Removable Hard Disk or the Cipher cartridge data streamer. This product is constructed with the highest quality possible — It is much more than a sheet metal box with a drive thrown in.

DYNAFRAME with 10M Bytes \$2499.00

• New Monochrome Graphics Board from AST.

AST has the Optimum Solution to Lotus 1-2-3 graphics on the IBM PC Monographic Monitor. It increases the resolution from 640x200 to 720x348 and eliminates eyestrain caused by the IBM graphics adapter. You also get a parallel printer port, clock/calendar w/battery back-up and options include serial port. Now in stock at ACP.

AST MonoGraphic Plus \$445.
Optional serial port add \$35.00

• Add Speech to Your PC.

For the past several years Street Electronics has been the leading manufacturer of speech products. Their ECHO™ speech technology is now available in the CRICKET™. The CRICKET has an RS-232 Serial Interface. Compatible with the PC and PCjr. Software included creates sound effects, music, natural voice, (over 700 words supplied) and Robot voice. It has its own speaker and jack for headphones or stereo. The CRICKET is also compatible with the "Music Construction Set" by Electronic Arts.

Cricket for PC or PCjr. \$135.00

If you're using VisiCalc®, Lotus 1-2-3®, MultiPlan®, SuperCalc® or Perfect Calc®, you need an analyst.

Specifically, a financial analyst. Like the BottomlineV software package. Because unless you've got hundreds of hours for programming, you'll go nuts doing financial planning, analysis, modeling or five-year forecasting with spreadsheet software alone.

Your personal financial advisor.

BottomlineV takes the mystery out of financial analysis and planning. Working with your spreadsheet software, it gives you instant access to the same profitability measures and financial ratios that bankers use to test investment soundness.

You'll know in seconds important long-range information—the kind of facts and figures that give you credibility when you establish lines of credit, raise venture capital or obtain a loan.

No programming required.

BottomlineV makes forecasting and modeling easy because it does hundreds of complicated calculations for you. That's right, it does hundreds of calculations. If you make a change to any part of your model, it will ripple through the entire model. Automatically updating it.

For example, suppose you want to know how an increase in sales will affect your profit picture.

BottomlineV will tell you.

First, it will revise your income statement (P&L).

Then it will update your balance sheet and cash flow to see if your goal is achievable.

It will even give you 24 different ratio analyses that will help you better plan and run your business.

With BottomlineV, you don't have to know computer programming. You don't have to be an accountant. You hardly even have to know how to

operate your spreadsheet software. Yet you will be able to see your complete financial picture. Instantly.

BottomlineV works with IBM®, Apple®, Kaypro®, DEC® and most other MS-DOS and CP/M systems.

It sells for only \$295.00. For that kind of money, no other financial analyst can give you so much good advice.

Go to your nearest dealer and ask for a BottomlineV demo. (Also ask about our CPA-approved Bottomline-TAX planning and preparation package.)

BottomlineV instantly produces the reports you need to see your complete financial picture.

Bottomline V

We take over where spreadsheets leave off.

Strategic Software Systems, Inc., 1300 Dove Street, Suite 200, Newport Beach, CA 92660 (714) 476-2542VisiCalc: Lotus 1-2-3: MultiPlan: SuperCalc: Perfect Calc: IBM: Apple: Kaypro: DEC and BottomlineV are registered trademarks of respectively VisiCorp, Lotus Development Corp., Micro soft Corp., Sercam Corp., Perfect Software Inc., International Business Machines Corp., Apple Computer, Inc., Kaypro Corp., Digital Equipment Corp. and Strategic Software Systems, Inc.

DBBUILD

The basic piece is the DBBUILD module, which creates the database files and the database schema (sort of a composite, multifile data dictionary). The DBBUILD module, like most of the other pieces, is a compiler. (This system leaves no doubt that compiled code is faster.) Unlike some other products in this survey, *informix* deals with one database at a time. Within that universe, all data element names must be unique, and the field reference in your code does not specify a file (since the tag is unique in the database).

The input to DBBUILD's compilation is a text file that you enter with a simple line editor or your favorite word processor. Following the PC test format, I created a database called PERSONNL, starting with an employee file. If you were using this database, you would build a description text file (for each file in your database) containing the name of the database, the name of the file, and the field descriptions.

Handing this text file to DBBUILD will create the PERSONNL database and incorporate your definitions as the first file within that database. With string data, you must specify a length attribute. With the other ten or so data types, the length is implicit. The file specification describes a primary index key field of employee number followed by a bunch of character fields. B-tree index files will be built and maintained for the index key and also for the last name, state, and zip code fields. For the three secondary keys, duplicates are allowed (they are not permitted for the primary key).

You type in this text file, then issue the command DBBUILD (textname). What you get a few seconds later is the database file (PERSONNL.DBD) and the employee files (EMPLOYEE.DAT and EMPLOYEE.IDX). Just repeat the process for the other files in the database, and each will be added to the structure as it is compiled by the DBBUILD module. Like everything else in *informix*, the compiler is fast.

In this example, you will notice that the data dictionary does not contain much control information. The dictionary is little more than a map of the field list for each file. Fields may be specified as character, integer, long, float, double, serial, date (three kinds), money, or composite. You may also indicate that a field is to be indexed by the system (you can't join it if it isn't indexed). Some indexes may restrict entry to nonduplicated data, whereas others can allow multiple occurrences of the key data. All of the control information normally found in a complete data dictionary is located in the screen generator package that includes the FORMBUILD and PERFORM modules.

While this approach violates the accepted standards for database design, it does have its advantages. It is easier to get differing database views since you can control the format and entry rules when designing the screen. A good systems designer will not allow this feature to get in the way—an inexperienced programmer might.

Once you have compiled a database with DBBUILD, you could immediately invoke the fixed-screen entry processor, ENTER2. (ENTER1 for line input terminals was not ported to the PC.) Calling up ENTER2 produces the same type of display as does the EDIT/APPEND command in *dBASE II*. It's not terribly exciting, but you can key in some records.

PERFORM

The fun starts when you start using the *informix* transaction processor, called PERFORM. The compiler front-end of this module is FORMBUILD, which must be run before PERFORM will strut its stuff. It is another two-step process, similar to that of the DBBUILD modules. First you use an editor to enter a set of screen definitions, then compile them with the FORMBUILD program. Once it is compiled (just a few seconds is all it takes), the resultant file can be executed by PERFORM.

This approach is straightforward, but it is also more tedious than that of some other systems for two reasons. First, it is not like interactive "screen painting" with the cursor. You use an editor or word processor and lay out the screen as a series of lines, one at a time. If you are not using a full-screen editor, you will end up practicing your four-letter-word vocabulary. Second, all of the specifications for field edits, display formatting, required fields, optional fields, default values, range tests, value lists, and so on are stored in the compiled screen, which means you have to key it in right there. (And you will have to rekey it if you build other screens using the same fields later.)

(continued)

You use an editor or word processor and lay out the screen as a series of lines, one at a time. If you are not using a full-screen editor, you will end up practicing your four-letter-word vocabulary.

Building a text file for FORMBUILD isn't difficult, and the examples found in the manual are excellent. The text file contains a database header line, a screen layout section, attributes definitions and rules, and master/detail file instructions (optional).

The first section simply names the database to be used. Then you present a picture of the screen, entering literal text and calling for database fields by a tag code. Following the screen layout, you list all of the tags that you used and insert the actual field name from the database schema, the edit rules, display formatting, and so on. In advanced, multifile screens you may add a final section that establishes (for this form only) the master/detail relations between multiple files. Sound easy? As a matter of fact, it is.

I don't have space to discuss all of the variations possible on an *informix* PERFORM screen. But you can work with elements from multiple files, perform composite joins on multipart keys, copy elements from one file to another without rekeying the data, and page through the detail records related to a single master record. When you remember that you are working totally within a packaged system without doing any programming, you can begin to appreciate what I mean when I say *informix* has real power.

The critical phrase in the last sentence is "without doing any programming." The product's capability to manipulate and display information without recourse to a traditional programming language is hard to imagine until you have seen it.

INFORM

The remaining pieces of the system handle queries, formal reporting, and language interfaces. The query function comes under the INFORM module, which incorporates a nonprocedural language that is relationally complete in every respect. You can select, sort, join, summarize, update, add, and delete at will. If that isn't enough, you may also create temporary files, perform mass (class)

updates, execute script files created with an editor, request on-line help, and unload sections of the database. Its major drawback is that joining is limited to two files that must produce a third, temporary file.

The *informix* manual has a 50-page section on the use of the INFORM module. Included are enlightening examples of both simple and complex queries (based as always on the sample databases included

The program can manipulate and display information without recourse to a traditional programming language—a feature you might find hard to imagine until you actually have seen it.

with the system).

A module called ACE handles formal reporting. I don't know where it got its name, but ACE is truly at the top of the heap of packaged report generators. Its documentation is over 160 pages long—one-third of the system manual. The authors have gone to considerable length to explain the features and capabilities of this potent module. ACE is as close as *informix* comes to a useable language. It can handle the normal range of select, sort, and display functions, but then goes far beyond that first plateau by offering IF-THEN-ELSE branch logic, combined ascend and descend sorting, detailed

numeric and string formatting, complex headings and control break logic, FOR looping, and access to C subroutines for whatever functions you can't otherwise accomplish directly.

Like all the other modules I have described, ACE works in two steps. ACEPREP compiles your text file describing the report to be produced, and ACEGO runs the compiled code to produce the desired output. The ACEPREP compiler creates a file with an .ARC extension and the same name as the text file that you have already fed to it.

Conclusion

The *informix* system is great, but it isn't perfect. It needs work in several areas before it can move to the top of my list.

The program's most serious deficiency is its lack of a procedural language of a caliber that matches the rest of the system. If it is revised to include one, *informix* will move into the finals of the competition. To force a reliance on C as the only language support is less than the best solution. The C library that comes with the system is complete and well thought out. But in spite of the growing pressure from Bell Labs, how many people do you know that are competent in C?

My other gripe is with *informix*'s handling of system diagnostics. Each module is crisp and quick to display a carefully numbered error message when something in your input is invalid. You might see something on your screen like "6020—there is no current record" and turn to that large manual for help. When you locate diagnostic message number 6020, what you find is this: "There is no current record." Not very helpful! A system as complex (internally) as *informix* should help you discover what you did wrong and tell you how to fix it. In virtually every case the data in the manual are an exact duplicate of the terse one-liner mocking you from the bottom of the screen.

Once those two flaws are fixed, you'll have the world at your fingertips.

—John Phillips

KnowledgeMan: The Professional's Tool

```
IF CURREC (SAL) = 0 THEN
  OUTPUT "No salary records."
  BYE
ELSE
  OBTAIN FIRST RECORD
  WHILE #FOUND DO
    IF EMPNO = TMPEMPNO THEN DO
      LET TMSAL = SALARY
      OBTAIN PRIOR
      LET CHNG = SALARY-TMSAL
      LET INCREASE = ((SALARY/TMSAL)-1)*100
      OBTAIN NEXT
    ELSE
      LET TMPEMPNO = EMPNO
      LET CHNG = 0
      LET INCREASE = 0
    ENDIF
    IF EDT (SAL) THEN BREAK
  ENDIF
  OBTAIN NEXT
ENDWHILE
ENDIF
```

A portion of a KnowledgeMan procedure showing nested IF's.

KnowledgeMan (short for KnowledgeMan) is a sophisticated micro-based database manager from MDBS, a company long associated with fine minicomputer-based software.

Perhaps the best description of KnowledgeMan is that it is a complete programming environment with emphasis on data management or, more simply, a sophisticated applications development system.

KnowledgeMan operations include data management, ad hoc inquiries, spreadsheet analysis, statistical analysis, screen I/O, forms management, printed

forms management, procedures, and functions.

The KnowledgeMan programming environment includes a Pascal-like structured programming language, a sophisticated macro facility, a powerful, easy-to-learn query language (a superset of IBM's SQL/DS), an optional screen-painting utility, and an optional business graphics utility.

Also, the KnowledgeMan programming environment includes an integrated 255 x 255 cell spreadsheet, internal control functions, math, string, and logic functions, and memory (virtual) variables limited in type and number only by available memory.

Hardware Limits Only

One of KnowledgeMan's strong points is that fields, records, files, and variables are virtually without limits in the program.

It can handle 65,535 records per table (data file), 65,535 characters per record, 255 fields per record, and 65,534 charac-

ters per field. It does not limit the number of data files that can be open simultaneously, the number of control breaks, command line length, index keys per table, fields per index key, or working (memory) variables.

In short, the only limits on KnowledgeMan are those of the hardware on which it runs.

The KnowledgeMan system comes on two double-sided, double-density disks with the root program, 20 or so overlays, and five utilities—in all, over 400 kilobytes of software.

Through the use of overlay files, KnowledgeMan can be run under PC-DOS with at least 192K RAM and 500K of mass storage—a single drive, in fact, if it can handle 500K.

Each of the overlay files contains a sub-

KnowledgeMan

Micro Data Base Systems, Inc. (MDBS)
P.O. Box 248
Lafayette, IN 47902
(317) 463-2581
List Price: \$500

Description: Relational

Requires: 192K RAM, 1 disk drive,
DOS 2.0, hard disk recommended.

Records per File: 65,535

CIRCLE 766 ON READER SERVICE CARD

Fields, files, and records are virtually without limits in KMan.

set of *KnowledgeMan* commands and features so you need only have on line those overlay files that you will use in the current session. *KnowledgeMan* is not copy protected so the floppy disk user can create various applications disks—say, one for screen I/O, another for program development, and a third for spreadsheet applications.

On the other hand, if you have 400K of RAM and a hard disk, you can simply put all of the overlays on disk or use a utility called MOMAN that links all or a subset of the overlays into a single .EXE file.

The heart of the *KnowledgeMan* system is its database manipulation capability. *KnowledgeMan* databases comprise tables (files) that contain records that in turn contain fields, the smallest addressable data element. Each of the fields in an active (open) data file can be addressed as a variable.

For example, suppose two data files are open—say, personnel and department—each of which contains records with one field identified as EMPNO, for employee number.

You could use the following commands:

```
SELECT DEPARTMENT.DEPTNAME
FOR DEPARTMENT.EMPNO =
PERSONNEL.EMPNO, ORDER BY AZ
PERSONNEL.LNAME.
```

```
LET LASTNAME =
PERSONNEL.LNAME
```

As you can see, *KnowledgeMan* uses an English-like syntax in its query language. Field variables are identified by field name preceded by filename and a dot. Thus DEPARTMENT.EMPNO represents the value for employee number in the current record of the table (data file) department.

Linking on the Fly

These commands operate on two files simultaneously, selecting a department name based on a link between the EMPNO fields in both data files.

An important point to understand about *KnowledgeMan* is that the link, or pointer, between the two EMPNO fields in the example above is created by the SELECT command and disappears as soon as the

The only limits on KnowledgeMan are those of the hardware on which it runs.

statement is executed.

In short, all *KnowledgeMan* relational links are created "on the fly."

Notice also in the example that the virtual (memory) variable LASTNAME receives the string value from the field variable PERSONNEL.LNAME. *KnowledgeMan* automatically decides on the variable type by the data it contains. In this case LASTNAME becomes a string variable with the assignment. If we later use the statement

```
LET LASTNAME = 5
```

the variable type of LASTNAME would become integer.

As seen above, database queries can be made on the fly with *KnowledgeMan*'s query language (SQL/DS) or via procedures (programs) constructed with *KnowledgeMan*'s PASCAL-like procedural language.

KnowledgeMan's procedure language uses structured control routines such as IF-THEN-ELSE, WHILE-DO, and CASE.

Additionally, any of the SDL/DS statements can be used within a *KnowledgeMan* program.

The *KnowledgeMan* environment includes an integrated spreadsheet, the cells of which represent variables that can be used in the same way as memory or field variables.

Conversely, a spreadsheet field can

express a constant, variable, expression, or even the result of a complete program stored on line.

KnowledgeMan permits extensive data security with different security codes; 65,792 possible combinations are available for different users right down to the field level. Therefore, programming can provide users with logs down to the field level. Encryption utilities are provided to encrypt program source code and data files, which further enhances security.

The program also permits extensive use of color for screens and spreadsheets. Video attributes (color, inverse, bright, blinking, and so forth) can be used in prompting and can be changed depending on the values of data entered or computed. When used with a financial planning spreadsheet, for example, the "bottom line" field might stay green when the value represents a solid profit, turn yellow if the value approaches break-even within 5 percent and turn red when the value becomes less than 5 percent under the break-even point.

I/O screens can be programmed or painted. The KPaint utility enables the user to type onto the screen exactly what should appear there and assign colors to fields and prompts using menu driven commands. Thus, the screen created can be stored in a program file or in binary format for immediate use.

KGraph is a sophisticated business graphing utility that can generate all classes of business graphs and many types of engineering curves. The screen can be divided into sections to show more than one graph at a time.

This multi-window graph format is especially helpful when playing "what-if" in the spreadsheet mode. Graphs can be set side by side or even overlaid to show the results of successive calculations.

KnowledgeMan is a professional's tool. It is highly flexible, but the price of that flexibility is complexity.

The professional approach is duplicated in the documentation. It is excellent,

TAKE THE 4-BOOK PC USER'S LIBRARY FOR ONLY...

DOS Primer for the IBM® PC & XT. By Waite et al.

A "hands on" look at the disk operating system for the PC, PC-DOS, including the latest version 2.0. Extensive at-the-keyboard examples and step-by-step instructions show what to type, what the response should be, and why it works the way it does. The *Primer* covers fixed disc, pathnames, and redirection, and explains concepts like batch processing, filters, and configuration. Publisher's Price: **\$14.95**

Learning IBM BASIC. Revised Edition.

By David A. Lien.

This exemplary guide helps you to get better acquainted with your PC while learning all the fundamentals of BASIC. In 420 example-filled pages Dr. Lien teaches you Elementary and Intermediate BASIC. You'll master: saving and loading programs, for-next looping, reading data, defining functions, assembling

strings and arrays, using sound, peeking and poking, merging and chaining, and much more.

LIFE IN THE PC FAST LANE

Our goal is to have what you want when you want it. On those rare occasions when we tell you we're out of stock, it means one of several things. The manufacturer is out of stock. A new, favorable review has created heavy demand. An announced product is still unavailable. Or, an updated version of the product is on the way, and we have no intention of sailing an about-to-be-obsolete product (even if it means losing a sale). Whatever the reason, rest assured we'll give as firm an availability date as possible.

OUR POLICY

- We accept VISA and MASTERCARD.
- No surcharge added for charge cards
- Your card is not charged until we ship.
- No sales tax
- All shipments insured, no additional charge
- Allow 1 wk. for personal & co. checks to clear
- COD max \$500. Cash or certified check
- 120 day guarantee on all products.
- To order, call us anytime Monday thru Friday 9:00 to 9:00, or Saturday 9:00 to 5:30

SHIPPING

Continental US: For monitors, printers, and drives, add 2% to all orders. For all other items, add \$2 per order for UPS surface, \$3 per order for UPS 2nd-Day-Air. We particularly recommend 2nd-Day-Air if you live west of the Mississippi or south of Virginia. In most cases it will only add \$1 to your cost and will save you up to four days on delivery time. UPS Next Day Air also available. **Outside Continental US:** We add freight charges to credit card purchases. For prepayment, call 603/446-3383 for information.

but it assumes that you are familiar with database structures, spreadsheet analysis, and structured programming concepts.

In order not to scare off beginners, I should point out that MDBS does have a 300-page beginner's tutorial in the works, and a draft copy looked pretty good. MDBS also conducts 2-day training seminars on a regular basis in major cities. The \$300 course is a must for the professional who is going to use *KnowledgeMan* in numerous applications.

KnowledgeMan basics—defining tables, adding or editing data, and using the query language—are all easily mastered. It is only when you want to take full advantage of the program's power that you need special experience or training.

The ideal application for *KnowledgeMan*, I believe, will be for those who must maintain many different databases, each with its own special I/O routines and security challenges.

MDBS user support is excellent. *KnowledgeMan* has undergone six version changes since it was first released in May 1983. Updates have been provided quick-

KnowledgeMan is highly flexible, but the price of that is complexity.

ly and without charge to the user. The company is responsive to user input; many of the updates incorporated "nice-to-have" features suggested by users rather than simply fixed up bugs.

All software involves compromise. The more a particular product attempts to do, the more complex it becomes. *KnowledgeMan* attempts to provide mini power to the micro world and it does a pretty decent job. As a professional's tool, it is among the best applications development products on the market.

—Richard N. Aarons

dBASE III: Advancing the Standard

The specter of *dBASE II* has haunted Project: Database since the project's inception. As the dominant database manager for the PC and one of the best-selling programs on the market, *dBASE II* has served as the unstated standard by which all the competitive products have been evaluated. Even though PC's editors asked Project: Database authors to consider each product on its own merits, it has been difficult to disregard such a de facto standard.

It is perhaps fitting that an entirely new member of the *dBASE* family has appeared just as Project: Database draws to a close. *dBASE II* has justly been criticized for its almost total correspondence to earlier 8-bit CP/M versions. Although compatibility and consistency are strong arguments for keeping 8- and 16-bit versions essentially identical, owners of 16-bit machines have complained that *dBASE II* does not take advantage of the power that their advanced hardware offers.

In response, Ashton-Tate has finally announced *dBASE III*, a new product designed only for 16-bit and larger machines. Of course, several other factors undoubtedly motivated this development. Project: Database is indicative of how competitive the database management field has become, and a new version of *dBASE II* was required to match the plethora of new products nipping at its heels. *dBASE II* was written in assembly lan-

dBASE III

Ashton-Tate
10150 W. Jefferson Blvd.
Culver City, CA 90230
(213) 204-5570

List Price: \$695

Description: Relational

Requires: 256K RAM, 2 disk drives or 1 drive and a hard disk, DOS 2.0.

Records per File: Limited only by disk space.

CIRCLE 758 ON READER SERVICE CARD

guage, so it was specific to the 8080/Z-80 and 8086/8088 microcomputer families. *dBASE III* is written in C, so its portability is greatly enhanced. Ashton-Tate will thus be able to offer *dBASE III* for UNIX, CP/M-86, CP/M-68K, and other current and future operating systems and microprocessors.

PC obtained a beta test version of *dBASE III* for evaluation. PC does not usually review prerelease software, but the obvious benefits of including *dBASE III* in Project: Database convinced the editors to make an exception. The length restrictions

of Project: Database reviews prohibit a discussion of all the aspects of *dBASE III*, so a much more detailed examination will appear in a future issue of PC. Some readers may not doubt appreciate a detailed comparison between *dBASE II* and *dBASE III* to determine whether upgrading to the new product is worthwhile, while others might want to examine *dBASE III* without reference to its predecessor. I'll try to do a little of both here.

Starting *dBASE III*

dBASE III is copy-protected with the Protok disk system. This will be annoying to hard disk owners, since the original distribution disk must be kept in a floppy drive when the program is first started. Ashton-Tate has not used copy protection

```
. SELECT 1
. USE deptsort
. SELECT 2
. USE person INDEX pemplnum
. SELECT 3
. USE salary INDEX semplnum
.
. SELECT 1
. SET RELATION TO empl_num INTO person
. SELECT 2
. SET RELATION TO empl_num INTO salary
.
. SELECT 1
. LIST dept_num, empl_num, person->l_name, salary->cur_sal OFF
```

This series of *dBASE III* commands is used to select three of a maximum of ten database areas and then open the three personnel files. The new SET RELATION TO command links the files by employee number. The LIST command specifies which fields from the three files are to be displayed.

previously, but one can hardly blame the company for wanting to protect its major development investment in the new product. Prolog works well, but can't somebody think of a way to avoid having to load a floppy?

On a more positive note, *dBASE III* looks for a file named CONFIG.DB when it starts up. Like the CONFIG.SYS file that DOS looks for at boot time, this text file contains single-line entries that can modify the default configuration used by *dBASE III*. A long list of attributes can be modified, including default drives, paths for searching for data files, use of an external word processor or text editor in lieu of *dBASE III*'s built-in editor, and so on.

Creating a Database

The normal *dBASE II* and *III* interface requires you to issue commands when presented with a period (.) screen prompt. The CREATE command starts the definition process, during which you specify a name, type, and length for each desired field. *dBASE III* has character, numeric, logical, date, and memo fields, the last two of which are new to *dBASE III*. Numeric fields use a new IEEE format for up to 19 digits of floating-point precision and 8087 compatibility (the current release does not support the 8087 math coprocessor, but the hooks are there for its future use). Date fields store dates in a normal MM/DD/YY format, and several new

functions have been added to manipulate date data. Memo fields are extremely long text fields that can hold up to 4,000 characters if the *dBASE III* editor is used to create them, or up to 512 kilobytes if created by an external word processor. Memo

dBASE III has character, numeric, logical, date, and memo fields, the last two of which are new.

fields are stored in separate disk files and do not take up space in the main .DBF data file, where a 10-character "placeholder" field indicates the existence of a memo field in an external file.

The CREATE process uses the full display screen and has been enhanced in *dBASE III* to use IBM graphics characters and more detailed prompting messages. An optional menu explains the use of the various editing and cursor keys; either the special keys available on an IBM PC or the old-style control characters can be used. Other enhancements include recaps of the number of fields defined, an indication of bytes remaining from the newly

increased total record length restriction of 4,000, and so on.

Entering and Editing Data

Entering and editing data also use enhanced full-screen displays. The APPEND and EDIT commands are used for normal operations to add or edit one record at a time. The BROWSE command can also be used for either editing a screenful of data from many records or to add new records. New *dBASE III* enhancements to the BROWSE command allow locking fields in place so that long records can be edited more easily, much like locking titles in a spreadsheet. You can also specify fields that you want to browse through. A modified full-screen CHANGE command adds interactive changing of specified fields to *dBASE II*'s bulk modifications of the values of all the records in a field. A new UPDATE command uses data from a file to make changes to an active data file, useful for batch modifications to existing data.

Help

dBASE III includes detailed Help screens called with the HELP command. If nothing follows HELP, a menu-driven HELP utility is called, which makes it easy to find the Help screen for the command desired. Alternatively, typing HELP BROWSE, for example, immediately displays help for the BROWSE command. The Help screens show the exact syntax required, the options available, and a brief description of how to use the command. They are much like the on-line manuals that come with UNIX and are extremely helpful, especially to remind experienced users how to employ the less frequently used commands.

Bigger news is the new ASSIST system. ASSIST is a completely menu-driven system that walks first-time users through most *dBASE III* commands. It is not merely help or a tutorial; ASSIST actually does things and executes the commands. The idea is to allow new *dBASE III* users to obtain most of the benefits of the system

without having to learn the myriad of *dBASE III* commands.

The screens are beautifully laid out and are easy to use. Simple explanations of each available command are provided. A rank beginner who had not even opened the manual might still have problems cre-

ASSIST is a completely menu-driven system that walks first-time users through most *dBASE III* commands.

ating a complete database system and inputting and accessing data, but ASSIST is both a major aid to using *dBASE III* and a valuable learning tool.

Retrieving Data

Traditional *dBASE II* commands such as LIST and DISPLAY can be used to output data to the screen in *dBASE III* or, with a new TO PRINT clause, to a printer. Fieldname headings may precede the listings of the fields. Various modifying clauses, such as WHERE and FOR, can be used to restrict the records displayed.

The *dBASE II* REPORT command, widely regarded as simplistic and limited, has been enhanced in *dBASE III*. A multiscreen input procedure allows you to define a more sophisticated output report than was possible before, including fields from multiple files, better aggregates, and other improvements. REPORT is still not particularly sophisticated as report generators go, but it is certainly easier to use.

Another new command creates mailing labels. LABEL uses two input screens to specify the physical characteristics of the labels to be used, including two-, three-, or four-across, various spacing options,

and what fields should appear where on the labels. Printing the labels is as easy as issuing the LABEL FORM command. The program handles labels with different numbers of lines automatically. Since programming this function in the *dBASE II* language was not an easy task, LABEL is a nice addition to *dBASE III*'s arsenal.

The *dBASE III* Language

In spite of the new capabilities of REPORT and LABEL, many reports will still have to be created with *dBASE III*'s high-level language. Programmers have long debated whether *dBASE II* really has a language per se or merely files with command sequences. Most users recognize *dBASE II*'s power as a language, and the new commands and functions included with *dBASE III* will strengthen that perception.

Among other additions, *dBASE III* allows up to ten files to be open at one time rather than only two. The SELECT command can now use up to ten workspaces for data files, and *dBASE II*'s requirement that they be designated as primary and secondary has been eliminated. The USE statement also sets the name of the data file as an "alias," meaning that the area can be selected with the SELECT customer command, for example. Alternatively, you can specify an alias other than the filename for a file/work area.

The SORT command now handles multiple fields and is fast. The AVERAGE command calculates averages. The PROCEDURE command opens a program file that you have previously created and that contains program segments terminated by the RETURN command. Once the procedure file is opened, each of the up to 32 procedures stored there can be called directly, without the delay normally experienced when a disk file is opened.

Several new language constructs make the *dBASE III* language more structured. Variables can now be categorized as PUBLIC or PRIVATE (akin to the terms global and local in other languages), to control the scope over which variables are active.

A new PARAMETERS command can pass values to called routines. The EXIT command leaves a loop and continues with the statement following the ENDDO command, for improved flow control. The RETURN TO MASTER command returns control to the "top" of a program system rather than to the program that called the routine, a useful feature in menu-driven application systems. An explicit CLOSE statement has also been added to the *dBASE III* language.

Other new commands make programming easier and improve the convenience of the operating environment. For example, the COPY FILE command can copy any file, the ERASE command deletes files, and the DIR command displays directories (with full use of DOS 2.x sub-directories). The RUN command executes any external program and returns to *dBASE III*, the SET command has several new settable parameters (and a full-screen command to modify them), the TYPE command displays or prints external text files, and the ZAP command completely clears a data file (like the DELETE ALL command followed by the PACK command does in *dBASE II*, but faster).

Perhaps the nicest addition to *dBASE III* is the SET RELATION TO command, which links two databases according to a key expression. This command is not the linkage mechanism used to work around the field limitations of *dBASE II*. The new command can be used to link multiple files so movement of the record pointer in one file also moves the record pointers in the linked files.

A few changes may require you to amend your programming style. Ashton-Tate has changed the DO WHILE command to forbid macros in the control statement, claiming a 30 percent speed advantage. *dBASE III* automatically releases variables created in a module when control passes to a "higher" module. This capability was needed more in *dBASE II*, where memory variables were limited to 64 rather than 256, and can lead to some interesting surprises.

(continued)

Several new functions have been added. The CDOW, CTOD, CMONTH, DATE, DAY, DOW, DTOC, MONTH, TIME, and YEAR commands handle character/date conversions and other date and time manipulations. String functions now include the AT and SUBSTR commands for substring search and selection, the LOWER and UPPER commands for case conversion, and the SPACE command to generate blank spaces. Other new control functions include the BOF, COL, DELETED, FILE, PCOL, PROW, RECNO, ROW, and TYPE commands.

Utilities

These language enhancements are exciting and useful. They make the *dBASE III* language much more powerful than *dBASE II*'s. However, compatibility is far from total. Converting *dBASE II* program files to *dBASE III* is not necessarily easy, depending on the complexity of the *dBASE II* source program. Ashton-Tate supplies a utility named dCONVERT to aid in the conversion process. The preliminary documentation includes an article by well-known *dBASE II* trainer Adam Green; it discusses dCONVERT's operation and points out the pitfalls. It appears that dCONVERT can be expected to perform perhaps 80 percent of the necessary conversion automatically. The utility marks lines it has changed with comments, which is helpful in seeing what the program has done. Suffice it to say that while dCONVERT is certainly helpful, quite a bit of manual effort is still required.

dCONVERT is also necessary to convert all the other files in a database system. *dBASE III*.DBF files have a different header structure than those in *dBASE II*, so they must be converted, too. dCONVERT doesn't convert index files; it creates a two-line program that can be run under *dBASE III* to recreate an appropriate index.

Ashton-Tate also provides a dFORMAT utility to paint screens and reports. After you have painted the desired format,

dFORMAT creates *dBASE III* language files with the code required to execute the screen or report. It works well.

Performance

Ashton-Tate emphasizes *dBASE III*'s speed improvement over *dBASE II*, especially with the SORT command. To check these claims, I loaded the three data files supplied by PC for Project: Database. The PERSON and SALARY files loaded in 31

Converting *dBASE II* program files to *dBASE III* is not necessarily easy, depending on the complexity of the source *dBASE II* program.

seconds each, and the DEPT file took 43 seconds. Given that some other database managers tested for the project took over an hour to load each of these files, this speed was certainly acceptable.

Sorting PERSON by last name took 44 seconds, about 4 times faster than *dBASE II*. Other sorts with various sample files on both character and numeric keys showed that *dBASE III* was always at least 3 times faster and sometimes 10 to 20 times faster than *dBASE II*. Indexing and other file operations were also significantly faster with *dBASE III*, but the speed increments were not as great as with SORT.

I was impressed with the little niceties added to the new product. The SORT command shows the percentage sorted during the sort process; many other commands provide an exact running count of their progress in a fixed position at the bottom of the display. Even COPY FILE shows the number of bytes transferred as it proceeds. *dBASE III*'s screens are much

more attractive than *dBASE II*'s, and the help provisions and operator prompting are greatly improved.

I created a language file to produce a simple report accessing all three PC data files. This would have been something of a task with *dBASE II*'s two-file limitations, but it was easy with *dBASE III*.

I deliberately indexed two of the sample files and sorted the third prior to beginning output. (This is actually not a bad way to program reports in a complex system because it ensures that all keys are current when a report is printed.) In earlier versions of *dBASE II*, such programming was so slow as to be unacceptable. *dBASE III* took only 1½ minutes to begin output—and that's for two indexes and a sort.

I was intrigued by the new SET RELATION TO command. The manual states that only one such relation can be set up in each of the ten work areas, but it occurred to me that perhaps I could relate the file in area 1 to that in area 2 and then relate the file in area 2 to that in area 3. This turns out to work.

Summary

dBASE III is a major advance over *dBASE II*. It is faster in almost all respects, its language is more sophisticated and powerful, its help and assistance support is more useful. The overall feel of the product is silky smooth.

At first I did not believe that the benefits of converting existing applications written in *dBASE II* over to *dBASE III* would justify the considerable time required. The more I worked with the new version, however, the more I felt that the added speed and convenience would make the process worthwhile.

dBASE III is likable, whether considered on its own or in comparison with its predecessor or competitive products. Ashton-Tate has produced another winner that will help assure the company's continued dominance of the microcomputer database market.

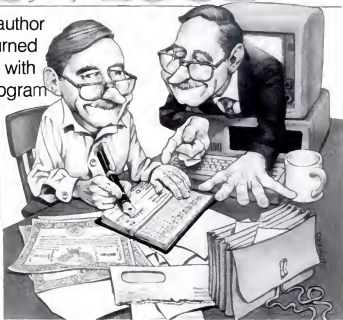

—Glenn A. Hart

How To Be Your Own Best Financial Advisor

Best-selling financial author Andrew Tobias has turned his talents to software with a personal finance program called *Managing Your Money*.

Andrew Tobias, Harvard MBA and author of such best-selling books as *Fire and Ice*, *The Only Investment Guide You'll Ever Need*, and *The Invisible Bankers*, has turned his creative talents to what he no doubt hopes will be another best seller, a personal finance program called *Managing Your Money*. The program, the result of a collaboration between Tobias and Micro Computer Corporation of America, is a kind of every-person's financial computer program that integrates financial, investment, home accounting, and tax programs for your PC, XT, or PCjr. Like several of Tobias' books, this program helps the average person gain mastery over a complex subject—in this case, personal finances.

Managing Your Money is a menu-driv-

en program with seven major components including insurance planning, budgeting and checkbook maintenance, investment portfolio management, income-tax estimator, financial calculator, a reminder

system for important dates, and a net-worth calculator. (The seventh function, also referred to as a "personal balance sheet," is actually a composite of the previous six functions, as it needs all the

MANAGING YOUR MONEY

information previously entered there to determine net worth.) An eighth module, which will serve as a telecommunications link for one or more electronic databases to automatically update securities prices, will be available this fall.

The package consists of three disks. Although you can make backups of the second and third disks, the first program

The first program disk is copy-protected, and you can't even make backups for security or archival purposes.

disk is copy-protected. You can't even make backups for legitimate security or archival purposes. Don't worry about inadvertently mixing up the disks, though. A beep and an on-screen instruction will tell you when to put which disk in which drive.

The program runs on either a monochrome or a color monitor, but the graphs are difficult to see without a color screen. So, after you boot up, change colors with the F1 through F10 special function keys to find a combination that's comfortable for your eyes.

Managing Your Money, Version 1.2
Micro Education Corporation of America

285 Riverside Ave.
Westport, CT 06880
(203) 222-1000

List Price: \$199.95

Requires: 128K RAM, one double-sided disk drive, 80-column color or monochrome monitor; printer recommended but not required.

CIRCLE 799 ON READER SERVICE CARD

Prompt Relief

The program, by and large, is easy to operate. After guiding you through the set-up procedure, the manual becomes unne-

cessary because the screen prompts you for every move. The extensive on-line help function, written in a conversational tone free of technological or high-finance jar-

SPF/PC™

ACTUALLY, there is no comparison. SPF/PC is the best full-screen editor available for the IBM Personal Computer.

It looks and works like IBM's large system SPF editor.

- SPF/PC can use up to 786K of memory as workspace.
- Word processing commands.
- 4-way scrolling.
- Split screen support.
- On-line help facility.
- Can edit up to 240 character records.
- Monochrome or color supported.
- Instantaneous screen display.
- Block Move/Copy/Repeat/Delete/Overlay/Shift/Exclude
- Automatic line numbering supported.
- 40 user-definable Program Function Keys.
- Direct interface to DOS commands for PC DOS 2.0 users.
- Browse sub-system.
- Move/Copy sub-system copies any file format.
- Utilities include: Rename/Delete/Print/Directory list.

AND MUCH MORE . . .

UPLOAD/DOWNLOAD sub-system available to SPF/PC users for \$50.00.

\$149.95 SPF/PC requires 128K, PC DOS, and 1 disk drive.

THE ODD-COUPLE™

Allows the APPLE and IBM/PC to communicate with each other.

- Connect APPLE to PC, APPLE to APPLE, and PC to PC.
- Transfer any file in either direction.
- CHAT mode allows direct communications through the keyboard.
- An Equipment Profile allows description of your operating environment.
- Communicate Direct or through a Modem at speeds up to 9600 baud (bps).
- Written entirely in machine language for speed and efficiency.

MANAGING YOUR MONEY

gon, tells you basically everything you need to know to run this program. Just hit the Esc key at any point for help. When you're done with the detailed on-screen explanation, hit the Esc key again and resume work.

There's also a comprehensive electronic index ranging from "archiving" to "who wrote what" reachable from the

After guiding you through the setup procedure, the manual becomes unnecessary because the screen prompts you for every move.

main menu. From the index, you can get a brief explanation of any listing as well as step-by-step directions on how to get to that particular part of the program. If you still feel insecure, print out a hard copy of the index.

To understand how the program works in practice, the following is provided as a discussion of how to use the components, both singly and together, to help make financial decisions.

For instance, if you are thinking about buying or changing insurance plans you will, no doubt, have questions. These might include: How much life insurance do I need? How much can I afford? What are my choices in the marketplace? With the insurance-planning option you can find answers tailored to your personal situation.

You can also get a good overview of the ins and outs of insurance from a consumer's perspective, including advice on how not to bother with life insurance unless you have dependents and an explanation of why you should buy term rather than whole-life coverage. Or, if you already

own a whole-life policy, *Managing Your Money* can analyze its investment value. This module will also inventory other insurance policies you may have, such

as life, health, auto, and homeowner's.

To determine your appropriate coverage, *Managing Your Money* will need certain facts. First complete the fill-in-

LePrint™
Letter Quality for your Dot-Matrix Printer

IBM PC
WordStar
Edition

LePrint takes advantage of the graphics capability of your dot-matrix printer to produce high quality print rivaling a daisy-wheel printer.

Like a daisy-wheel, LePrint gives you a variety of type faces such as Courier and Prestige Elite, but without the bother of changing print wheels. You can easily change type faces on the same page or even mix faces on the same line!

Like an expensive typesetter, LePrint brings you letter sizes from under 1/12 inch (this size) to over 10 inches high. LePrint produces beautiful, proportionally-spaced and justified text with type faces such as Times (Roman and *Italic*), **Clarendon** and *Park Avenue*.

Best of all, LePrint is designed specifically for use with WordStar®. LePrint can print your existing WordStar documents without modification—including embedded print controls and dot commands. If you use WordStar you already know how to use LePrint.

LePrint is available for the IBM® PC and compatibles. Many popular printers including Epson and Okidata are supported.

Call today for additional information,

MANAGING YOUR MONEY

the-blank life-expectancy questionnaire. Based on such factors as age, occupation, gender, marital status, life style, occupational risk level, and even how often you

wear a seat belt, the program will determine your projected life expectancy. Further answers to questions about how much money your dependents will need annual-

ly and how many years you want to provide support for them will help decide what insurance plan is best for you.

This module is good for "what-if" scenarios. For example, if you think the premiums are too high for the recommended face value of a given kind of coverage, substitute different amounts, and you can find out what kind of posthumous support would be provided.

You can define special codes for up to 26 individuals or institutions that recommend investments to you.

Experiment with the projected interest rate for the policy principal, or the number of years of support.

No-Fuss Budgets

The budget and checking component will store transactions for accounts you set up, typically checking, charge, and savings accounts. And there's a field to indicate the tax status of any transaction, including the Internal Revenue Service form that should be used to reflect the expenditure or source of income. Because of the interrelationship between the *Managing Your Money* modules, transactions entered here will automatically be reflected, where appropriate, in other modules, such as the income-tax estimator and net-worth statement.

The program, because of its flexibility, is good for home or small business budgeting. For example, you can replicate one month's budget figure, such as January's \$350 rent, for each month of the year. Or you can have a figure automatically altered, say, by compounding January's base \$175 dividends by 1.5 percent for each subsequent month or by increasing each month's sales commission by

Beyond Board-Driven Networks

MultiLink™ is a unique networking system which doesn't require costly "Network Interface Boards." Instead, it transforms ONE IBM PC/XT™ (or compatible) into the CPU of a multi-tasking, multi-user network.

Four Workstations for the Price of One... with a Software-Driven Network. With MultiLink™, you can utilize up to eight inexpensive terminals as workstations. Four of these terminals cost less than one PC.

MultiLink™ runs under all releases of PC-DOS™ (except 1.0) and certain implementations of MS-DOS™. A wide range of leading programs which include WordStar™, Lotus 1-2-3™, Peachtext 5000™, and dBASE II™ are fully supported.

A Resource-Sharing System. Multiple users are able to access all of your computer's resources, locally, or from remote locations using a terminal with a modem. Features include disk, file, and program-sharing; a dial-in bulletin board, and a comprehensive print spooler.

Make the MultiLink™ Connection Today. Call The Software Link TODAY, and get the whole story. MultiLink™ is immediately available for \$295 and comes with a money-back guarantee. VISA, MC, and AMEX accepted.

MultiLink™

CIRCLE 393 ON READER SERVICE CARD

\$334.49. The program comes with sample budget categories that can be tailored to your situation. Despite Tobias' avowed lack of knowledge about computers, one budget category is predefined for software and computer hardware expenditures.

Graphic displays make the numbers even more comprehensible. Figure 1 shows a chart of a family's income sources including salaries, dividends, interest, and gifts. You can also create a bar graph comparing actual against budgeted expenditures.

Your Investment Counselor

Monitoring investments is a breeze with the investment portfolio management module. Data entry is facile, as is updating the market price of your assets. You can define special codes for up to 26 individuals or institutions that recommend investments to you—allowing you to recall whose sage counsel left you holding an empty bag. And you can mark portfolios either as taxable, as tax-deferred Individual Retirement or Keogh accounts, or, if you like playing the stock market with imaginary dollars for fun or practice, as hypothetical.

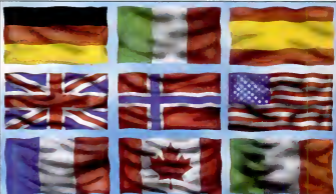

When you log onto the portfolio management function, its memory displays any significant events. You'll be advised, for example, that a holding is moving from short- to long-term status or that the scheduled date for clipping a coupon or rolling over a Treasury bill is fast approaching.

With the program, portfolios can be analyzed for appreciation and yield, individually and in the aggregate. You can also do graphs in a variety of ways, by risk level from low to speculative, by industry group, liquidity, and taxable or tax-free status. The program also compares what you've paid in brokerage commissions with what discount brokerage firms would charge for handling the same trades. "We're not saying you should switch, just letting you know roughly what your broker's advice and personalized service cost so you can make an informed decision,"

the program informs you.

Here, as in the budgeting and check-book component, the number of recordable transactions is limited by the memory

capacity of your system. However, selling shares in Electronic Pseudointelligence, Ltd., or dumping your Old Hickory Distillery 8.7 percent bonds will help to free

Word Wand—L'Éditexte Speaks your language

Word Wand is a unique, multi-lingual program designed specifically for your IBM PC and other compatible microcomputers such as the Hyperion, Compaq and Corona. Whether you're a professional or academic, Word Wand saves you time and money. Incredibly simple to operate, Word Wand can be used for any Roman Language (ENGLISH, FRENCH, SPANISH, GERMAN, ETC.), and takes away the intimidation

associated with the use of a computer. With versatility and ease of operation in mind, it displays and prints all accented characters or even line graphics. And now, Word Wand, in conjunction with Immedia introduces a completely bilingual electronic mail system. Field proven and Government bench marked with flying colours, Word Wand is the most effective and versatile Word Processing system available today.

WORD WAND—L'ÉDITEXTE

Multi-lingual Word Power

MANAGING YOUR MONEY

up memory for active investments.

The most common use for the portfolio manager module is keeping track of traditional investments such as stocks and bonds. However, it can also be used to track your collection of stamps, antique silver spoons, Canadian coins, or Civil War tokens. It's even possible to use it to keep tabs on the mileage credits you accumulate under airlines' frequent-traveler programs; each new trip adds miles to your "holdings."

Numbers Crunching

With the financial calculator, you can maintain records of outstanding loans, analyze real-estate investments, do retirement planning, and handle such mathematical chores as calculating monthly mortgage payments and compounding interest.

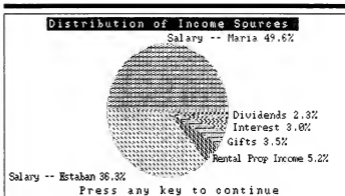

Figure 1: A chart of income sources generated by *Managing Your Money*.

Even though I'm not looking to retire in the near future, I found the retirement-planning process fascinating. To use this

function, select "retirement planning" from the financial calculator mini-menu. As you can see in Figure 2, the screen

POWER-BASE™ PUTS YOU W

"Power-base" is a menu-driven data management program with relational capabilities. It was the top-rated program overall, primarily because it was the easiest to learn and use, and rated highest in error handling"
The Ratings Book/Software Digest, March 1984

"To track the Bank of New England's IRA sales for all 16 branches, I chose Power-base" because it responds so well to change while protecting the integrity of my database." *Bruce Montgomery, Bank of New England*

"This program is impressive—it's easy to use, simple, logical, and powerful and comes with flawless written documentation."
Giovanni Perrone, InfoWorld, March 12, 1984

"Because you don't have to wade through screens full of menus, the program is fast. Because your choices are always in front of you, the program is easy. Not much more you can ask for, is there?"
Bobbi Bullard, Computer Retailing, April 1984

MANAGING YOUR MONEY

The Landlord Option

If you own rental property or are thinking of buying some, choose "investment analysis & rental properties" from the

financial calculator mini-menu. With information you provide on the mortgage rate and term, maintenance expenses, anticipated rents, property tax payments,

and depreciation, you can measure net taxable income or loss on the property, after-tax cash inflow or outflow, cumulative cash flow, and internal rate of return. That knowledge could help head off a costly mistake, give you timely warning to abandon a bad investment, or reassure you that buying that centrally located, 23-unit apartment building last spring was a wise move.

By assimilating numbers entered in other modules, *Managing Your Money* can calculate your net worth. The cash value of insurance policies, the market value of your mutual funds, and the balance in your savings accounts are reflected as assets. Conversely, unpaid credit-card purchases and outstanding student loans and mortgages are reflected as liabilities.

Using the net-worth calculation, you can also input assets and liabilities that were not previously entered into your calculations. For example, you could inventory the turquoise jewelry or the rare stamp collection in your safe-deposit box or enter the market price of your three antique cars. Their value would then be included with your other assets.

The Icing and the Crumbs

Some extra touches add value and user friendliness to this package. One such touch is the on-line calculator, which you call onto the screen with a mere touch of the NumLock key. Using the calculator you can enter equations or formulas in the work area at the bottom of the monitor, then transfer the answers to the appropriate field.

Flexibility is another desirable feature. There are no grating error messages, for example, when you enter data without commas or dollar signs. Instead, the program quietly accepts what you have given it and automatically puts it into the proper display form.

A third asset—especially for novices—is the program's reassuring style. "There is practically no way you can screw things up," you're told early on.

"Volkswriter® Deluxe..." the critics' choice!

“Thirty word processing programs were reviewed ... no other program received a higher overall evaluation than Volkswriter Deluxe.”

Software Digest Ratings Newsletter,
January 1984

“If WordStar™ set a standard ...

Volkswriter Deluxe sets a new standard

for transparency, simplicity, and speed. You can learn Volkswriter in under an hour ... because it does so many things exactly the way you think they should be done.”

“VOLKSWRITER DELUXE is the best buy in the IBM-PC™ writing tool arena.”

Charles Spezzano, Whole Earth Software Review, January 15, 1984

“Volkswriter Deluxe ... a simple way to word processing power ... for writers who like to think.”

Washington DC Capital PC User's Group Vol. 3, #4

“Lifetree ... provides exceptionally helpful and competent assistance to registered owners, and the company's update policies are excellent.”

“In sum, this is a unique word-processing program.”

John Lombardi, Reviewer,
InfoWorld, April 16, 1984

CIRCLE 385 ON READER SERVICE CARD

Lest you be daunted by the magnitude of moving your finances into the computer age, the program gently advises that it will take "a little time and discipline to get organized," but then shows why it can be time and discipline well invested.

Managing Your Money can't do everything, and not everything it does is done

By assimilating numbers entered in other modules, *Managing Your Money* can calculate your net worth.

well. This deficit is acutely evident around April 15. Its tax estimator does exactly that—estimate. Estimates may be helpful for tax planning and for girding yourself against the shock of what you owe Uncle Sam, but it's no substitute for a dedicated income-tax software program replete with tax forms and tables. The IRS doesn't work according to estimates.

Another limitation is that you can't make a screen print of a graph on your monitor using the standard PrtSc-Shift combination unless you first run the "graphics" program on DOS 2.0 or a later version. If you try, the system will crash and must then be rebooted, as I learned the hard way.

I was also irked by the author's computerized plugs for his own books. For example, if you look up "reference books" in the index, you'll be referred to Tobias' *The Only Investment Guide You'll Ever Need*; this kind of self-promotion is more appropriately tucked away in the back of the manual in a special bibliographic section.

Speaking of the Manual

And speaking of the manual—well—the problem is that there's not much to speak of. It features a sketchy overview of

the program, a few cautionary words, information on ordering computerized checks, and a start on the setup procedure. It consists of a paltry 38 pages beaming

with white space, good only for doodling. But all in all, these are only quibbles about a program that proved to be far more than expected. ■

HOW THE DUMMY OUTPERFORMED THE IBM PC.

Alloy's PC-PLUS turns a dumb terminal and your IBM PC into a multi-user, multi-processor PC DOS system.

Until now, adding extra users to your office system has presented some real problems. Additional PCs are costly. And the problems get tougher when you need shared data access and communication between PCs. Alloy's revolutionary PC-PLUS solves these problems. For \$1195 for each user processor and the addition of a dumb terminal, PC-PLUS transforms your IBM PC into a powerful multi-user, multi-processor system.

In any system requiring more than one PC, PC-PLUS provides a more powerful and less expensive alternative. PC-PLUS is almost twice as fast as an IBM PC. And PC-PLUS is ten times faster than LANs (Local Area Networks) at

half the cost. It also eliminates the cost of LAN controllers, taps, and expensive cabling.

So whether you're adding your secretary or 15 colleagues, Alloy's PC-PLUS can do it at a much lower cost and with higher performance. Best of all, it's available right now. See PC-PLUS in action at Computerland®, Businessland, and at your local dealer. Or call Alloy today at 16171 875-6100.

Cool Caterpillar

A game called *Changes* brings the mysteries of the Orient to a scrolling maze-chase starring a caterpillar, while Mr. Cool is a simple but fun descendant of Q-Bert and J-Bird.

Ah, the inscrutable Orient, home of gaudy red and yellow dragons crafted from papier-mâché, of Thousand-Year-Old Eggs made fresh daily, and of computers called Oranges and Tangerines. The Orient—where what you see is not necessarily what you get.

So it is with *Changes*, what I understand to be the first software imported from Asia for the IBM PC. It comes from Tigervision, the computer game division of a company called Tiger Electronics, which markets various kinds of electronic toys. *Changes* is made and packaged in Hong Kong.

I must confess to being uncertain about my feelings toward this game. It is by no means a breakthrough concept like *Lode Runner*; it is not a programming tour-de-force like *Flight Simulator*; it is nowhere near as nerve-racking and all-consuming

A view of one end of a *Changes* maze reveals a bad guy in hot pursuit of the quickly crawling caterpillar.

as *Crossfire* or *Styx*. It's not even that much fun to play over and over again. Nonetheless, it does possess a few nice touches of design and graphics that piqued my interest.

The story line, what there is of it, goes like this: "Guide the caterpillar through the maze in the forest eating all the power pills but beware the maze is infested with monster insects." (Don't blame me for the grammar, please.) "This is a maze game like none you've ever played before: multiple mazes, multiple and changing paths,

horizontally scrolling mazes and surprises you'll find only by playing."

Realistically, though, it's hardly a "maze game like none you've ever played before" unless you're one of the 17 people in the United States who have never played *Pac-Man*. It uses the same concept of power pills that allow you to turn the tables on your pursuers and gobble them up for points. But there are some differences, the principal one involving the concept of "horizontally scrolling mazes."

Actually, I tend to think of *Changes*

The best boards for the IBM PC at the right price...from the right place

When you buy IBM compatible boards you want performance, not problems or guesswork. So Heath has done the checking and comparing for you. We now sell the finest boards for Heath/Zenith and IBM PC computers. We'll back these products with our 90-day, money back guarantee and we'll back you with instructions on how to install or connect them.

You can buy boards like **AST SIX-PAK PLUS™** 64K memory with room for 384K, serial and parallel ports, printer despooling, clock/calendar with battery back-up, plus a game adapter port for IBM-type joysticks. You get six popular features for just \$359.00.

With the **DG ANALOG GAME PORT** you can plug in analog devices like joysticks and graphic pads. Supports graphics and joysticks for only \$49.95.

The **NOVATION ACCESS 1-2-3 MODEM** has software selectable 300/1200 baud plus auto-dial and answer. Includes "Crosstalk," the best-selling PC modem software.

An automatic self-contained communications system for \$549.00.

DG MAGIC RAM has four memory banks, individually addressable for 64K or 256K chips. Prices start at \$199.00 for 64K.

And those are just the boards! We also stock top names in computer peripherals, software, accessories and computer furniture. All checked for quality performance. So, forget the guesswork. Buy all your computerware at the right price from the one right place. Heath/Zenith.

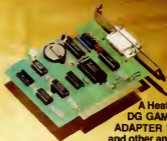

NEW MS-DOS® Course.

Now you can learn the operating system of the IBM and Heath/Zenith PC's. Complete step-by-step self-study course shows you how.

*MS-DOS is a registered trademark of Microsoft Corporation.

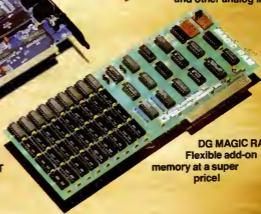

The right place is easy to find! 64 stores throughout the U.S. See page 4 at right for locations.

AST SIX-PAK PLUS™ Six most popular functions at a great price!

A Heath exclusive!
DG GAME PORT ADAPTER for joysticks and other analog inputs.

ACCESS 1-2-3 SMART MODEM. A complete telecommunications package.

DG MAGIC RAM. Flexible add-on memory at a super price!

PC ARCADE

maze as vertically scrolling, but let's not quibble. What you see on the screen represents perhaps one-third of the maze. As you guide your caterpillar to the top or bottom of the screen and beyond, the maze moves up or down like a window shade. It's fun to watch and a nice way to pack more maze onto the PC's screen without having to reduce the size of the image. It also allows changing the aspect ratio from the standard 4:3 television-screen format to an elongated scroll. (This scheme has not been used much for games for the PC, but it's used to great advantage in a new game for the PCjr, called *Microsurgeon*, in which you are engaged on a *Fantastic Voyage*-like adventure inside a human body, which is, as we know, usually taller than it is wide.)

Changes also incorporates a unique use of switches in the maze. These switches are bridges from one section of the maze to another. After you guide your caterpillar across one of the bridges, it rotates 90 degrees to connect different points in the maze. If you do it right, you'll temporarily cut off your pursuers; do it wrong and you've boxed yourself in with the bad guys.

Speaking of bad guys, I have nothing nice to say about the authors of the game's instructions. You're essentially on your own with this one, folks. For example, theoretically a joystick can move your caterpillar around the maze. In practice, however, I found it difficult to make the sort of precision moves needed for a high-scoring game. The game was much more playable using the keys on the keyboard, but the instructions did not even hint that the game could be played this way. I had to figure that one out for myself.

The game maintains high scores only in RAM; no record is made on the copy-protected disk. There is no pause control mentioned in the instructions, but I found you could stop the game with the Ctrl-NumLock key combination (unfortunately, this caused some unpredictable re-starts). There is no way to shut off the sound, and no reset key is provided.

Fast Switchover

I cannot recommend *Changes*' two-player version because the switchover between turns comes so fast that I can't see how you could play against a partner unless that partner were sitting in your lap. Then again. . .

I'm also not pleased with game manufacturers that do not provide a screen shot or a realistic artistic rendering of the appearance of the game on the model of computer the product is aimed at. The gaudy red-and-yellow box for *Changes* does attract the eye but tells nothing about the nature of the game inside.

Changes is obviously derived from the

Changes hints at more promise for the future than it delivers in the present.

aforementioned *Pac-Man*, as well as *Dig Dug* and other above- and below-ground maze chases. These games are not bad as ancestors go, but very little new ground is broken here. *Changes* hints at more promise for the future than it delivers in the present. Perhaps we should judge this early import from the East in light of the knowledge that the original Japanese cars were scoffed at and ignored by Detroit. That turned out to be a mistake. And don't forget that *Pac-Man* was a Japanese invention. Who knows what else is coming down the pike? Perhaps a space shoot-'em-up featuring papier-mâché dragons and Thousand-Year-Old Eggs.

I'm going to give this one a lukewarm score and hope for better fortunes to come. This game is a treat for the eyes, but a bore for the brain. On *PC Magazine*'s rating scale from a low of 0 to a high of 6, *Changes* earns:

FUN:	3
CHALLENGE:	3.5
GRAPHICS/SOUND:	4.5
TOTAL:	11

Herbie Briggs has just destroyed the myth that all floppy discs are created equal.

They seem equal. Until you look at the seams.

That's where equality ends.

Most companies seal their discs with a spot here, a spot there. Leaving most of each seam not sealed at all.

Sooner or later, the seams might do what comes naturally: they bulge. Warp. Pucker. Open up.

Pens, pencils, fingernails—even a four-year-old's, like Herbie—can catch and snag in those wide open spaces.

That's sloppy. And dangerous. Because if you put a sloppy floppy into your disc drive, it can jam your drive. Ruin your drive head. Lose your data.

So much for their seams. Ours are different.

THE SLOPPY FLOPPY:

Scaled with a spot here, a spot there. Leaving unsealed seams everywhere.

Memorex uses a process we developed, called Solid-Seam Bonding.

Solid-Seam Bonding seals shut every inch of every seam of every Memorex® floppy disc. Tight as a drum. That makes the Memorex

floppy stiffer. Stronger. And your data safer.

To resist bulging, warping, puckering, or opening up.

MEMOREX SOLID-SEAM BONDING:

Every inch of every seam is sealed shut. Tight as a drum.

To resist all the things that can jam your drive, ruin your drive head, or lose your data.

Which proves that a Memorex floppy disc isn't equal to all the others. It's better.

Solid-Seam Bonding is just one example of the extra care that goes into every Memorex floppy disc. Be it 8", 5¼" or the new 3½" Extra care that lets us guarantee every Memorex disc to be 100% error-free.

The next time you're buying a floppy disc—or a few hundred of them—just remember this:

It's always better to be safe than sloppy.

For more information on the full line of Memorex quality computer media products, including computer

tape, call toll-free: 800-222-1150. In Alaska and Hawaii call collect: 408-987-2961.

Your Data. When it matters, make it Memorex.™

CIRCLE 371 ON READER SERVICE CARD

There's no denying that BASIC is a fine language: it has probably helped you learn a lot about programming computers. But now that you know how to program, isn't it time to take the next step — to a language that was designed to help you quickly develop software that is fast, compact, and portable?

BASIC-C can help you make the transition smoothly. It's a library of C functions providing BASIC's high level capabilities you've come to know so well. Functions for string handling, sequential and random I/O, graphics, and many more — all designed to look and work like BASIC.

You get the source code to BASIC-C, extensively documented. It provides many examples to help you learn how to write C functions, and if a function doesn't suit your specific needs... change it!

C-Source provides a complete development package: the BASIC-C Library, a full screen editor, and a choice of two C compilers. Buy it all, or just the pieces you need.

CIRCLE 732 ON READER SERVICE CARD

Mr. Cool, yet another in the long list of offerings from Sierra On-Line, is an improvement upon the already wonderful arcade game *Q-Bert* and its personal computer compatriot, *J-Bird*. Your goal is to control a funny-looking little ice-cube-shaped guy called Mr. Cool as he jumps up and down and from side to side around a pyramid of differently colored landing positions. In the early part of the game, each time he lands on a position, the color changes. The goal is to turn all of the positions to a single color.

In the upper reaches, the colors change several times. In the topmost reaches, some of the positions in the pyramid are missing. In the highest of the high, some of the positions often disappear.

Mr. Cool must avoid passing the Hot Springs and occasional Fireballs that tumble down from above. And, in a nice fillip, your little ice cube must not only avoid contact with the Hot Springs and Fireballs, he must also take care not to land on a position on the pyramid too soon after they've been there, for the pyramid retains heat—and you've got to stay cool.

You can also invoke "Super Cool Time" by pressing the lower button on the joystick. For a few seconds, the attackers are transmogrified into ice water. (There are only a limited number of Super Cool Times on each level.)

This game plays much better from the joystick than from the keyboard. However, designer Pete Oliphant has devised an unusually well-thought-out choice of keys if you must use the board: D is up/left; K is

► Pascal and C Programmers

SUMIT ACCOUNTING WILL SET YOU FREE

I bought a PC for my company. We used it for spreadsheet word processing, and bookkeeping. We learned a lot, but what these programs really taught me was the true meaning of confinement. Almost everything I absolutely had to have, I couldn't get.

I wanted 2000 customers, it couldn't keep that many. I wanted a special sales analysis report—no way. My programs couldn't even use new features of the operating system. I was shackled by some dumb programs and was looking for a way to escape. I was looking for freedom.

I tried lots of packages—until I found SUMIT. I couldn't lose with SUMIT's money back guarantee. Using SUMIT, I produced a unique collections

report which helped tighten our receivables. Nearly overnight, our AR turns went from eight to ten! SUMIT had paid for itself even before my 30 day trial was up!

SUMIT runs with Revelation.* But, I bought the DOS version for \$895, and was so impressed with Revelation, I bought it later. If you already have Revelation, SUMIT is only \$495. Send your check (plus tax in California) to Sum Data Systems, 3224 Thatcher Avenue, Marina del Rey, California 90292, (213) 306-2808. Test SUMIT out for 30 days. If it doesn't free you from the limits of your PC, send it back for a complete refund.

With SUMIT running my business, our executive office has become rather informal. This month we're in Papeete—next month Pago Pago.

PC ARCADE

up/right; M is down/left; C is down/right; the spacebar stops Mr. Cool; S calls for Super Cool Time.

The game includes a pile of nice features, including maintaining high scores on disk, a toggle to turn the sound on or off, a pause control that uses the Esc key, a restart option, and a return to the main menu. The menu options, by the way, offer you the choice of a starting level, which is a good way to practice on the upper levels, and a quick route into the more challenging reaches.

All in all, *Mr. Cool* is, well, pretty cool. On *PC Magazine's* scale, it ices this issue's competition:

FUN:	5
CHALLENGE:	4.5
SOUND/GRAPHICS:	4
TOTAL:	13.5

■ This advanced *Mr. Cool* screen shows the main man himself at the top of the heap.

Gaining Financial Control: Two Guide Books

Business Decision Making for Higher Profits and *Automating Your Financial Portfolio* are two books that can help you use the PC for maximizing business and investment earnings.

Business *Decision Making for Higher Profits A 1-2-3 Business User's Guide*, is part of a series focusing on using 1-2-3 for financial applications. This book was designed for managers of small businesses who want to use a personal computer and Lotus' 1-2-3 software to improve their financial decision-making.

The reader is led step by step through the process of building several financially oriented Lotus' 1-2-3 worksheets. Among the topics covered are simplified income statements, balance sheets, and financial ratios. These are tied into an analysis of fixed and variable costs and fairly complete. While a total newcomer

break-even point determination.

The reader learns the basics of small-business accounting by actually building the analysis. Instructions are detailed and

to computers might not be able to construct the spreadsheet, almost anyone else would have no trouble. Each chapter includes useful hints on specific 1-2-3 commands. An accompanying optional diskette contains all the spreadsheets described in the book. This diskette saves you the trouble of entering the examples by hand.

While the authors succeed admirably at teaching basic computer-spreadsheet

skills, they do not cover any of the advanced features that make 1-2-3 special. These include keyboard macros, data management, and graphics. As constructed, the examples only use very simple spreadsheet techniques.

Same Simple Level

The book treats financial analysis at roughly the same level. The income statement and balance sheets have been simplified to the point where many lines are entered as predetermined numbers instead of being calculated by the reader. For example, interest expenses are not based on the external debt, which makes it possible to double debt while leaving interest expenses unaffected. There is no discussion of accelerated versus straight-line depreciation, which is unfortunate because these differences have important consequences on net income and tax liabilities. Presumably the business owner would want to try out several different "what-if" scenarios based on different allowable depreciation schedules. The text glosses over the point that the book's balance sheet uses cash as the calculated item that forces assets to equal liabilities plus owner's equity, a good way to track a company's financial position.

In spite of these limitations, *Business Decision Making* does provide a good starting point for people who want and

BOOK REVIEW

need a set of examples of spreadsheet applications for business analysis. To its credit, it focuses on the financial analysis problem as a whole, not only on Lotus'

I-2-3. The worksheets that the book constructs, too simple to be useful for an actual business, could still form the basis for real-world analyses.—R.W.

Automating Your Financial Portfolio: An Investor's Guide to Personal Computers compares succeeding in the stock market to trying to shoot down enemy planes from a moving ship: The planes are the stocks, the ship represents your financial position, the ocean is the equivalent of general market conditions, and the weather is like the general economy. Author Donald Woodwell maintains that until recently, massive firepower was required to hit one plane, that is, to choose a single high-flying stock.

Today, the same computer technology that has revolutionized naval warfare can be used by investors to choose the most worthwhile investments. According to Woodwell, a computer-controlled stock-evaluation program can allow you to accurately select and track your stock in any economic climate or market condition, and getting a computer to help you invest more successfully implies that you are serious about using it to increase your income.

A Rare Find

Automating Your Financial Portfolio is one of those rare books that will interest both novice and experienced investors as well as general computer owners. The many topics covered include the basics of proper financial planning; choosing the software for monitoring and analyzing bonds, real estate, stock options, and related investments; and choosing from among the various information utilities. Moreover, the author gets his points across plainly and quickly, while requiring you to learn only a minimum of computer and financial terms.

The book points out that most investors can do almost all the financial planning and investment analysis they need with only four basic software packages: an electronic spreadsheet, a personal finance manager, a program for communicating with an information service, and a tax-preparation program. Other programs, such as portfolio managers, technical analyzers, and data management

APPARAT TAKES YOUR PC TO NEW REALMS.

Imagine your PC with disk drives from Apparat. Imagine where it could take you.

Special values from the hard disk experts. For example, imagine your IBM PC or Portable PC with hard disk capability. Apparat's external Hard Disk Subsystem is completely compatible, running DOS 2.0 or 2.1 without modification or device drivers. And now you can get more capacity — 22 and 33 MB formatted configurations — for less money: 22 MB for \$2,295, 33 MB for \$2,995. Apparat also offers external or internal 10 MB drives at similar savings.

XT owners — trade in your 10 MB drive for a larger Apparat hard disk drive. Our 22 MB drive is \$1,299, but you pay just \$899 with the trade-in of your existing 10 MB drive. Our 33 MB drive is just \$1,799, but you pay just \$1,399 when you trade in your existing 10 MB drive. Call the Apparat ordering hotline for trade-in details and shipping instructions.

TEAC or Panasonic floppies. These half-height floppies are perfect for your PC, PPC or XT. Call for trade-in prices on half-height floppies.

Other Apparat add-ons. RAM cards for the PC and XT — 64K, expandable to 512K, \$189. COMBO II card for the PC and XT 5 functions on one card — \$189. GRAMBO for the PC, page-backs COMBO II on 512K RAM card — (64K RAM installed) \$359. 64K internal PRINT SPOOLER with parallel interface — \$229. Stand alone at \$299.

Warranty. All Apparat manufactured PC boards sold after June 1, 1984 covered by our exclusive lifetime limited warranty covering parts and labor. All prices subject to change without notice.

CIRCLE 768 ON READER SERVICE CARD

ing how much cash you can get your hands on when you need it can give you an edge . . . by enabling you to respond more quickly to market conditions."

While the author is optimistic about the uses of a computer to help investors make better investment decisions, he believes that a computer is merely a means to an end. It is the investor, not the computer, who must make the actual decisions. "The final selection of stocks in your portfolio is a judgmental decision," says Woodwell. "By themselves, indicators only point out trends and possible directions in stock prices and volumes. It is up to you to understand the interpretation of these indicators and apply them."

Woodwell advises that it is extremely important for investors to integrate all of their personal finances into their automated portfolios. He claims that the in-

terrelationship among the various parts is vitally important to the success of your total program. You must always ask yourself, "Has my net worth increased as a result of my investing efforts?"

Using the proper software, you can play "what-if" with the tax consequences of a variety of investments. You can then choose the one that offers you the best after-tax performances. One of the major reasons for investors to use computers is that it forces them to define their investment objectives in quantitative terms. Therefore, he advises investors to be "precise in recording details and to fully define the relationships between the various elements in your portfolio."

A copy of *Automating Your Financial Portfolio* should be within easy reach of any serious investor's computer, portfolio, and checkbook.—R.K.

CONDOR Data Management Software

Compatible

IBM PC-

compatible

Relational Data- base Management

is the effective way to manage
your office automation needs,
such as personnel management,
inventory control, billing, manufacturing
systems, educational, and other office,
school or home needs.

With Condor you get the power and flexibility of a fully
relational database system complete with a "Step-by-
Step" MENU system to guide the new user. On-line
help is integrated into the Menu system. A complete
REPORT WRITER is also included, that even the new-
comers in our field recommend.

With Condor, setting up a new database of information,
is as simple as typing on a blank sheet of paper . . . typi-
cally, it takes a minute, maybe two. You are then ready to
enter your data into the database you just created, again just
like typing on a sheet of paper.

Then, you can SORT, SELECT, COMPUTE, POST, or PRINT your
information in almost any way that you desire. Plus, you can easily pass
information from Condor to your word processor's mail-merge, or pass spread-
sheet information into Condor. It's all very easy, and also very English.

Begin with Condor Jr. (\$195), the advanced file manager. Upgrade later as your business and your data
grow, to Condor3 (\$650-or less the \$195 if you bought Condor Jr.), the fully relational data
management system. It's the same system that hardware manufacturers like DEC, Sony, Zenith,
and Hewlett-Packard have selected to market with their personal computers. There are
over 100,000 satisfied users. To find out how condor data management soft-
ware can make your business easy to handle, see your personal computer
dealer, or call 1-800-221-8479 (in Michigan call
0-313-769-3992 collect) for your nearest dealer. He'll prove
our point. That Condor is the data management software powerful
enough to be useful to business, yet simple enough for business to use.

IBM is the registered trademark of International Business Machines Corp.

MICROcentre™ Work Stations

Engineered to Optimize Business Efficiency

MICROcentre™ workstations provide immediate access to your business system, maximizing efficiency in as little as 10 seconds.

When seconds Microcentre opens your business day ready to give you full command and comfortable access to your system, with all components positioned at your fingertips.

A conveniently located surge, spike and noise protecting power center* allows you to activate your entire computer system at the turn of a switch. Now you're ready for a productive business day!

With the same ease used to access your computer you can confidently exit your workstation by locking your valuable hard-

ware and software with the same Lockmaster locks provided by Microcentre.

Although generous in features, each Microcentre model is frugal in the use of floor space and can be readily relocated to give maximum flexibility for your computer use.

Since you cannot select the right workstation unless you have a choice, Microcentre offers a variety of models and colors in premium quality laminates and beautifully hand-finished woods to meet your specific requirements.

The unparalleled efficiency and superior quality of Microcentre guarantees a sound investment and a workstation you can depend on.

Accounting For Contractors

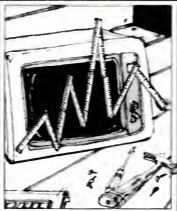

Computerized accounting packages offer benefits to all kinds of contractors. You'll need to choose carefully to make sure you end up with one that fits your particular requirements.

Personal computers have given construction contractors, like many other small businesses, the ability to automate their bookkeeping and accounting functions. Whether you're a general contractor tracking your subcontractors or a subcontractor with a large payroll, there are a wide variety of accounting programs available for the PC that will meet most of your requirements. But a contractor's requirements can go beyond the scope of most general-purpose accounting programs, so contractors looking to automate must shop carefully to find the features they need. These include special payroll (multistate, multiunion, variable workman's compensation, variable overtime rates), accounts payable (subcontract retention, lien reports), accounts receivable (contract billing, retainage calculations), purchase order control, job cost accounting, and equipment costing.

Payroll

Contractors' payrolls can be highly volatile and complex. Employees are regularly added, laid off, and rehired, and each employee's hours may vary from week to week, depending on the weather.

In addition, construction workers may be paid at different wage rates for different

tasks. In some cases, premiums are paid for working in more dangerous locations, such as higher elevations or tunnels. Similarly, the workman's compensation insurance rates vary depending on the craft the employee is working, his job, and the jurisdiction the project is in. To further complicate matters, workman's compensation is computed on only the straight-time portion of overtime pay.

And if handling straight-time rates seems complex, don't forget that construction work often involves two or more overtime rates (time and a half, double,

triple, and shift premiums). In addition to normal payroll output—checks, W2 forms, and payroll taxes—workman's compensation, equal opportunity employment, and certified payroll reports may be necessary. For contractors with many jobs scattered around town, a routine that facilitates distribution by printing payroll checks in job order is often desirable.

If you are a small contractor looking for a program to handle payroll, you should begin by making up a checklist of the items required for your particular operation. Start by collecting copies of all reports produced by your current payroll system. Next, determine the number of employees the system must handle, including those who might be laid off after a particular job is finished but must be maintained for possible rehire. Then try to predict the maximum number of people your business might add in the next 3 to 5 years. Finally, determine what payroll periods your hourly and salaried personnel are paid on and make sure the program you choose supports these factors.

For nonunion contractors working in one state with a stable work force and employee wage rate, a standard, off-the-shelf payroll package may do the trick.

(continued)

MENU FOR YOUR EPSON

Now you can have full menu-based operation of all control functions of all of the Epson MX, FX and RX printers. **Printer Boss™** software lets you send all of the complicated control codes, in seconds, by making menu selections with a few simple keystrokes.

Select and **deselect** pica, elite, compressed, italic, enlarged, emphasized, doublestrike, underline, superscript and subscript for scores of different type faces. **Set** line spacing, right and left margins and skip-over-perforation. **Load** USA, France, Germany, England, Denmark, Sweden, Italy, Spain and Japan language sets. **Control** unidirectional, half-speed and proportionally-spaced printing. **Store** and **retrieve** 10 complete menu settings with a few keystrokes. Create ASCII files of data, corresponding to the stored menu settings, which can be accessed by or included in your own programs to set up the printer as required. **Emulate** the IBM-label printer for the IBM-PC, eliminating print-out problems with IBM-PC software and Epson FX printers. **Download** to FX printers five different **IBM character sets**, including graphics, screen and APL characters and greek symbols. Print two-pass **letter quality** on your FX at **full text-mode speed**, up to 10 times faster than with programs using graphics mode. Print multi-page **spreadsheets** as wide as you like, **sideways** on your paper, in a choice of five different type sizes. Or create a **printer buffer** of up to 32K. Ideal for **IBM graphics** software, or **screen dumps**, or printing text from **Wordstar**, **Lotus 123** or many other fine programs.

Printer Boss™ for the IBM-PC and compatibles \$59.95. With Letter Boss™ letter quality or Sidekick™ sideways print option \$99.95. With both \$139.95. Visa, MC, or send check. Free info. Dealers welcome.

ENGINEERING

But as you begin adding special requirements, it becomes necessary to look for payroll software specifically designed to serve the needs of construction contractors. Fortunately, there are a number of such programs for the PC on the market. Most are part of integrated accounting systems and range in price from under \$600 to over \$2,000.

Job Cost Accounting

Integrally connected to payroll, job cost accounting allows the contractor to track labor costs according to type of work performed. Also known as costing, job costing, or job cost estimating, is a method whereby cost codes are allocated to the contractor's expenditures—payroll, material, equipment, and other items. These accounts are usually grouped by work type, specification divisions, phase, or location. As the job progresses, the contractor can produce reports that show exactly how much money is being spent and where. This information is then compared to the estimate for the job to give the contractor productivity information and to help identify problem areas. The cost data developed from completed jobs also helps estimate future jobs more accurately. Careful planning of the account codes, accurate reporting from the field, and software that can manipulate the data to produce useful and timely reports are all necessary to properly use this complex but valuable tool.

Accounts Payable

Contractors generally have a high volume of purchasing activities, including buying materials to be incorporated into the job, buying small tools and supplies, leasing equipment, and administering sub-contracts. An accounts payable system can help the contractor save a substantial amount of money when it comes to determining short-term cash needs, taking advantage of vendor discounts, and borrowing cash when accounts receivable shows a shortfall.

For a small contractor, finding a suit-

able accounts payable package should not be a problem; many off-the-shelf products will be sufficient. As in payroll, though, be sure to pay attention to the number of vendors a program can maintain and the

Finding a suitable accounts payable package should not be a problem; many off-the-shelf products will be sufficient.

volume of transactions it can handle. Also look for special features that may be useful, such as provisions to produce and/or check vendor invoices against purchase orders. Of course, if you're buying a complete accounting system, you want to be sure that accounts payable information will be automatically posted to the general ledger and job cost functions.

Accounts Receivable

The accounts receivable needs of contractors can vary considerably. General contractors are often retained by the owners with whom they have contracted. Their accounting systems should treat such retainage amounts not as an accounts receivable but as earnings withheld.

Maintenance contractors such as HVAC (heating, ventilation, and air conditioning), mechanical, or landscape firms often require an automatic billing system to produce invoices on a regular basis, much like the utility bills you get at home.

In some types of construction contracts, the contractor is paid according to a "draw schedule." The draw schedule specifies predetermined amounts of money to be paid at the end of an account period, typically each month, based on completion of certain amounts of work or

ENGINEERING

accomplishment of specified milestones.

General Ledger

Contractors have much the same general ledger requirements as most other businesses do, but they especially like to see multicompany capability since they often need to set up supply and equipment rental operations as separate entities. Unfortunately, multicompany capability is found mostly on minicomputer systems.

For IRS purposes, contractors need the ability to report revenue and expenses on both a "completed contract" and "percent-of-completion" basis. The first method means that expenses and revenue are not recognized until the contract is completed. The latter method allows the contractor, at the end of its fiscal year, to prorate revenue and expenses on the basis of the amount of the contract that has been physically completed. Contractors commonly keep two sets of books, one for IRS purposes and one for financial conditions. Such contractors require an accounting system that can report on both.

More than Bookkeeping

Computerizing the accounting functions of a construction company goes far beyond the mere automating of a few bookkeeping tasks. Computerization gives the contractor the opportunity to track costs, ride herd on subcontractors, manage cash flow more effectively, and eliminate duplicate payments or overpayments to vendors. Important financial statements can be produced quickly and accurately, helping the contractor to expand as the opportunity arises.

The technology has advanced so quickly that, whether you are automating just one function or installing a complete integrated accounting system, PC-based accounting systems can now practically match the features of minicomputer systems of only 4 years ago. Evaluate your own needs, familiarize yourself with the available options, choose carefully, and be sure to have your accounting firm give its approval to the package you ultimately select.

PC LOGO™

Coping with Complexity: PCs in Neurobiology

The PC, together with devices such as analog-to-digital converters, is helping scientists at the University of Illinois study nerve cell plasticity in marine mollusks.

Understanding how the mammalian brain functions is one of the last frontiers of biology. The human brain's level of complexity for information processing is staggering. It contains roughly 10^{11} nerve cells (or neurons), each capable of interacting with hundreds of thousands of others. Perhaps the most significant technological advance in neurobiological research during the past few years was the introduction of computers to help cope with the tremendous complexity involved. Because of their versatility and power, microcomputers are becoming critical pieces of laboratory hardware in neurobiology.

Neurobiological research entails probing the mechanisms by which nerve cells function and interact with one another to produce behaviors and store and manipulate information. Even with help from a PC, mammalian brains are so complex that neurobiologists are often forced to start with a simpler system. Molluscan neurons are tens to hundreds of times larger than their mammalian counterparts, yet they number only in the thousands. And, in spite of their relative simplicity, mollusks display discrete, quantifiable behaviors and are capable of simple forms of learning.

Studying the giant nerve cells of mollusks can offer significant insights into the functioning of nerve cells in more

complex organisms.

Drs. Martha and Rhanor Gillette and I are investigating mechanisms of nerve cell plasticity in the marine mollusk *Pleurobranchaea*. Through our research, we have identified an ionic current, stimulated by an endogenously occurring compound, cyclic 3'5' adenosine monophosphate (cAMP), and regulated by calcium ions. The presence of cAMP induces this current and changes the excitability of the neuron. The two main avenues of our research are the mechanisms of cAMP induction of inward current and the regulation of cAMP activity by intracellular enzymes.

We use an IBM PC with a Tecmar 12-

bit analog-to-digital (A/D) converter. A/D conversion allows the collection and analysis of data while an experiment is in progress. It is a great time saver, since collected data does not have to be transferred to a computer or calculator for analysis.

In addition, on-line collection is often the most accurate method of data collection. Most importantly, collecting data on-line allows continuous monitoring of the progress of the experiment, and immediate analysis of experimental results means more efficient use of time and resources.

At the heart of the A/D converter is an integrated circuit that transforms the in-

WE TURN
YOUR IBM PC INTO
MORE
THAN JUST A PC.

Want your PC to talk to your mainframe? You'll get all the right connections with VTERM II; Coefficient's DEC* terminal emulator for the IBM* Personal Computer.

Coefficient brought you the first VT100* emulation for the IBM PC. With VT100, VT52*, VT101*, VT102*, printer support, file-exchange and much more, VTERM II was a great communicator. Now VTERM II gives you an even better line to your mainframe with lots of new features: error-free file transfer including host software and XMODEM mode; optional 132 column display; autodialing; on-line help; plus a unique softkey command system that lets you automate many communications functions. And that's not all. VTERM II has one advanced capability that really puts other emulators on hold: a single key that lets you switch instantly back and forth between DOS and VTERM II, without ever losing your terminal screen or communications link. So call Coefficient today for VTERM II.

VTERM II IS ALSO AVAILABLE THROUGH
YOUR LOCAL IBM BRANCH OFFICE.

SCIENCE

coming voltage into a TTL (transistor-to-transistor logic) signal that the computer can handle. This process compares an unknown input voltage against some form of internally produced reference voltage. The reference voltage is changed until the difference between the two voltages falls below the resolution of the chip.

Integrated circuits can utilize several different methods of A/D conversion. The most common—as well as the fastest and most accurate—method is successive approximation, whereby the input voltage is compared bit by bit and complete conversion is accomplished in n steps for an n -bit converter. The dual-ramp (or slope) method, which is commonly found in most digital panel and multimeters, is also very accurate but has a much slower conversion time. The ultra-high-speed parallel technique is used for very-high-speed conversion, but its resolution is limited.

A/D and D/A packages can be assembled in several ways. Discrete components allow one to mix and match for the optimum system, but they generally require a better working knowledge of the whole system. The popular hybrid (multichip) converters are comprised of a ready-to-use package of components. Monolithic (single chip) converters are very inexpensive but generally not as good as hybrid or discrete systems. Successive-approximation hybrid A/D converters are probably the most appropriate choice for biomedical research.

Resolution is another consideration when choosing an A/D system. The selection is generally between 8, 12, 14, or 16 bits, and the choice depends on the desired speed, accuracy, and cost. Systems using 8-bit A/D converters are the most economical, easiest to use, and fastest, but the accuracy is only 1/256 of the full voltage range. Twelve bit A/D converters have a resolution of 1/4096 of the full voltage range and are still fast enough for most biological phenomena. A/D converters of 13 to 16 bits are available and

are not too much slower than 12-bit converters, but the increased resolution is marginal.

Once the type of A/D converter and number of bits have been determined, a

On-line collection is often the most accurate method of data collection.

couple of other considerations remain. An A/D chip can convert only a limited range of input voltages. The most common input voltage ranges are 0 to 5, 0 to 10, and -10 to +10 volts. The proper range depends on your specific needs, but since negative potentials are frequently encountered in neurobiology, the -10 to +10 volt range is best.

It's useful to have several counters on your A/D board. If your instrumentation puts out a TTL-compatible signal, they can function as straight counters, and they can be cascaded to handle very large numbers. Alternatively, the counters can be programmed as clocks to trigger conversion to real-time data collection.

Signal conditioning is often necessary prior to data collection. Input signal gain should be scaled to take full advantage of the converter's input voltage range. Variable amplifiers to take care of this are simple to construct and work quite well. Even better, many A/D boards feature software-programmable gains that are easier to manipulate during an experiment. Other signal conditioning devices include active filters to minimize unwanted noise prior to data collection and variable low- and high-pass filters to produce a narrow "window" of acceptable frequencies.

Our Tecmar Lab Master 12-bit A/D converter uses the 40 kHz switching frequency and programmable gain options to record membrane currents during patch and voltage clamping. Patch

THANKS TO COMPU SERVE'S CB SIMULATOR, "DIGITAL FOX" ACCESSED "DATA HARI" AND PROCEEDED TO AN "ALTARED" STATE.

The CB Simulator, where CompuServe Subscribers can Access Friends and Influence People on 72 Different Channels.

Just pick your handle and get on line. From math to matrimony, there's always someone out there who speaks your language. Friends from all over the U.S. and Canada are at it 24 hours a day. Talking tech or just having fun. And if you've got a secret, just use the CB Scrambler.

That'll fool the "lurkers," those CB "see it alls" who get their kicks by watching. Or you can always use the private talk mode for guaranteed one-to-one conversation.

The CB Simulator is just one of CompuServe's many electronic communications options that include a National Bulletin Board, Professional Forums and Electronic Mail. Plus, there's a world of on-line information and entertainment all for the price of a local phone call plus connect time.

You can access CompuServe with almost any computer and modem, terminal or communicating word processor.

SCIENCE

clamping is a new technique that allows electrical isolation and recording of a single-membrane protein channel. With this method, discrete openings and closings

of iontophores can be monitored. We use this technique to examine the effects of cAMP and synergistically and antagonistically acting compounds on membrane

current. The current flowing through each protein channel is roughly 1–2 picoamps (10–12 amps), so a good deal of amplification is required. Mean open time for each channel varies in the range of .1 to 10 milliseconds, so it is clearly necessary to sample as quickly as possible. We read the A/D signal from the port, immediately assign the value to a memory location, and then repeat the process until all usable RAM is filled. With this method, we can sample every 40 microseconds, with sampling periods of longer than 15 seconds. After the RAM is filled, the number in each memory location is read, converted to a voltage, and analyzed. We sample several 15-second bins to establish a baseline channel activity prior to experimental manipulation, and we then sample after the treatment to discern the change in channel activity.

Whole-cell voltage clamping involves monitoring the current flowing across the entire cell's membrane while holding the neuron's voltage at a desired potential. The current recorded is the summation of all the single-channel activities. The events of interest occur much more slowly (20 milliseconds to 60 seconds) than during patch clamping, so a slightly different A/D paradigm is required. Our voltage clamp experiments frequently involve intracellular injection of compounds or step changes in voltage, so A/D conversion is externally triggered to precisely coincide with the manipulation, and the voltage is sampled at regular intervals following the triggering stimulus.

The general types of research problems and methods of analysis we encounter in neurobiology are analogous to those encountered in many different areas of biology. With minimal effort, the PC and XT can be adapted to facilitate research in these other areas. ■

Daniel Green is a research assistant in neural and behavioral biology at the University of Illinois at Champaign-Urbana.

The Dawn of a New Age.

The Information Interface

The First Information Management System That Takes Your P.C. Seriously.

Combines, in a single integrated system, all of the historically separate functions of database manager, report generator, query language, forms facility, database definition, data dictionary, and programming language.

The first commercially available Information Management System which uses the Entity Relationship Model of Data. It captures not only data, but also the way in which it is structured. Generates information applications as much as 20 times faster than conventional methods.

Bank Market Analysis on the PC

An integrated package built around a database management system can help commercial banks organize information about their individual and corporate customers.

Insight into your markets is a business necessity whether your company offers autos, perfume, widgets, or financial services. In commercial banking, competition is keen and customers are astute at selecting services by quality, features, and price. The PC can be a powerful aid to increasing insight.

A commercial bank offers a wide array of credit and service products, and each of its markets will utilize a different subset of those products. (A market is an aggregation of customers or prospects for a specific product or service or a group of products or services.) Within the broad market categories in commercial banking, there are many subgroups that, if identified, aid in making the business more profitable.

In the consumer sector, for example, some basic subgroups might be lower-income customers utilizing installment loans, credit cards, and checking accounts; upscale professional and managerial families utilizing the aforementioned products and, in addition, money market accounts, cash reserve, discount brokerage, and personal financial planning; and high-net-worth individuals utilizing financial planning, collateralized loans, and trust services. Within each of these subgroups there are still further refinements that would help marketing, such as the customer's age, whether or not he is a homeowner, and degree of credit risk.

The institutional sector can be broadly cut between domestic and international. In each category there are correspondent banks composed of smaller retail-oriented banks, regional banks, large commercial banks, and money center banks. In addition, the international sector includes central banks. The institutional sector may also include insurance companies, investment bankers and brokers, and financial "conglomerates." Again, further refinement will be extremely useful—by asset size, geographical location, and financial condition, for example.

Segmentation can help marketing planners identify those markets that contribute most to the bank's profitability, those that

contribute to its prestige and reputation, and those that do both. Credit executives can plan levels of commitments and outstandings among the types of lending. Sales managers can optimize their calling plans. Product managers can enhance existing products to better meet the needs of customers. Marketing managers can optimize their use of the media for advertising and more carefully target direct mail promotions. Planning and budgeting management can more effectively allocate money, people, and equipment by market. Operations and systems can plan ahead.

Help From the PC

How can a PC help in all these areas? The number of ways is limited only by your own needs and responsibilities.

With database management software you can organize, reduce, and analyze data on customers acquired in the course of establishing relationships and processing transactions, to identify market segments. You can collect ad hoc competitive intelligence as obtained in sales calls, conferences, or informal sources for enhancing products and competitively pricing them, and you can track calls on customers and prospects.

With a spreadsheet you can model market behavior under varying price assumptions; track and analyze customers' use of credit and services to estimate market seg-

FINANCE

ment profitability, identify cross-selling opportunities, and target promotions more accurately; and forecast sales of a given product in a particular market or across markets.

Linear programming software can help you optimize allocation of scarce resources such as advertising and promotion budgets, systems personnel, and equipment. With statistical tools or your own statistical routines written into a spreadsheet you can analyze survey results, perform Bayesian analysis of alternative possible outcomes in new product introduction, and segment a market with discriminant analysis.

With graphics software you can vividly portray for senior management such important analyses as budget required, profitability breakdowns, and sales forecasts. With cooperation and interfaces on

the mainframe end and communications hardware and software on the PC side, you could download useful data from various bankwide transaction-processing systems.

Almost All-in-One

A powerful integrated package could perform many of the functions in the above laundry list, and anything the program could not do could be handled by transferring data to another package, since each of the integrated packages mentioned provide data-transfer capabilities. A second approach would be to emphasize the database aspect of the task, build the system using a relational database package, and transfer data to an appropriate program as needed for spreadsheet, graphics, or other applications.

To be useful, marketing information

must be fresh. While it need not have the precision of accounting data, it does change over time. The software you choose should enable regular updating and maintenance, and a database management system would be most helpful here. Data will be coming from various sources (customer information files, lending or relationship officers, product production areas, demand deposit accounting, commercial loan processing, industry publications) and in different ways (diskette, paper, modem). An easy-to-use but flexible data entry system is essential, and communications and data conversions are highly desirable. Finally, many inquiries against the data will be ad hoc, so the ability to query the data easily would be helpful. The ability to restructure the database is almost essential, since you will think of elements to add as you become more

Get your Epson's worth with Set-FX+™

SoftStyle™

SoftStyle, Inc. • Suite 205, Dept. C • 7192 Kalaianaele Hwy.
Honolulu, Hawaii 96825 • (808) 396-6368

Set-FX+ adds big pluses to the versatility of all Epson printers.

- ☐ Simple-to-set print modes, including condensed, emphasized, italics and many more.
- ☐ Print those missing IBM characters, including line graphics, math and science symbols.
- ☐ Create special characters or even design custom fonts.
- ☐ Pivot Printing™ to rotate text 90° for super wide spreadsheets.

Convenient access to your printer's full capabilities, plus even more.

There are no difficult codes to remember or program. Set-FX+ menus put printer power at your fingertips!

Set-FX+ software comes with a clear, complete instruction manual, and quick reference guide. Set-FX+ even includes an Ideas program and special fonts to get you started. Special fonts include IBM, Old English, Greek symbols, plus others.

No Epson can afford to be without Set-FX+. Only \$59.95.

To get your Epson's worth, ask your dealer for SoftStyle's Set-FX+ or order direct.

Toll-free orders: 1-800-367-5600

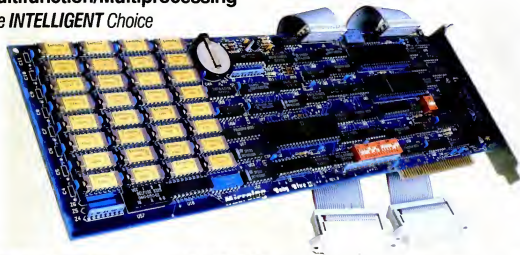

For the IBM PC, PC-XT, PCjr, Compaq and IBM compatibles running DOS. Compatible with the Epson MX, RX, FX and LX printers as well as IBM graphics printers (MSX needs Graphics I/O). Set-FX+ prints in full speed test mode on the FX printer. MC-VISA accepted. Add \$2 shipping/handling, U.S. and Canada (\$10 for others).

BabyBlue II

Multifunction/Multiprocessing

The INTELLIGENT Choice

Packed with ALL the popular features:

- Up to a 256 Kibabyte Memory Expansion, optional in 64K blocks.
- Clock/Calendar with long-life battery back-up (choose replaceable or optional rechargeable battery).
- Parallel Port for use with IBM/Epson and most other parallel printers (addressable as LPT1: or LPT2:).
- Two (2) Serial Ports addressable as COM1: and COM2:, OR use our unique extended port addressing to configure for serial devices other than COM1: and COM2: (i.e. pointing devices, graphics tablets, etc.).
- Baby Blue II is fully compatible with the IBM PC, the PC/XT and other compatibles, including the Texas Instruments Professional Computer.

Not just another DUMB multi-function board.

With all that hardware to manage, we think a board should have a brain. You won't find this feature on other boards—they may look pretty, but they can be pretty boring once you get them home. Baby Blue II is actually a second computer inside your PC, built around the high-speed 2-80B microprocessor.

• Background Processing:

Compile, assemble, sort, calculate, communicate or print—all in the background, while you and your PC continue to work on other tasks in the foreground. Because it is a separate computer, Baby Blue II performs these functions without slowing down your PC, helping you to do more work in less time.

• Autostart at Preset Time:

Baby Blue II can begin any task, even a background operation, at a specific time by consulting the on-board real-time clock.

• CP/M Capability:

Baby Blue II offers instant access to the vast CP/M-80 library of mature, professional software for every conceivable application.

• Dual Ported Memory and I/O:

You can use Baby Blue II's memory, ports and clock as ordinary enhancements to your PC. Or, you can let our 2-80 micro-processor control the board directly, for truly independent background operation.

All this and SOFTWARE too . . .

Systems utilities

PDO RAMdisk Software: create a FAST pseudo-disk drive of any size in available system RAM. The DOS 2.0 version lets you change the size of your RAMdisk from the keyboard.

Print Buffer/Spooler: a TRUE print spooler: the 2-80 buffers and manages printing independent of your PC. Unlike other so-called "spoolers", this one won't stop your printer or slow you down when you start another job.

Clock Software: sets Baby Blue II's clock and initializes the system clock at boot time—never type the time and date again!

Communications

Smart Terminal Emulator Package (STEP): talk to other microcomputers or connect to larger host computers, as an asynchronous terminal through Baby Blue II's serial ports. Unlike other "smart terminal" programs, STEP offers full emulation of popular video display terminals (the standard package includes Teleview 950 and Hazeltine 1500).

IBM 3101, DEC VT100 and many others are optionally available. You can send or receive text files, and with STEP's unique Sessions Menu, changing your configuration is a keystroke away.

BSTAM File Transfer Utility: Transmit and Receive text, HEX, and binary files (including .COM files) without errors and without fuss. BSTAM is easy to use, with all configuration parameters handled transparently under STEP.

CP/M-80 compatibility

Baby Blue Conversion Software: Microlog's famous CP/M Emulator turns CP/M-80 programs into PC-DOS programs for fast, efficient execution on Baby Blue II. Completely transparent operation using standard PC-DOS commands—freely mix PC-DOS with CP/M programs and text/data files on the same PC-DOS disks.

Convert: supports bidirectional file transfer between PC-DOS and popular CP/M disk formats.

Keyfix: automates your keyboard with 54 programmable function keys for CP/M programs, eliminating tedious typing chores (max. 80 characters per key).

Baby Blue II (64K installed) \$ 695.

QUALITY you can count on . . .

Microlog is in the business of producing high quality, intelligent computer peripherals. Extensive factory testing gives our products one of the highest reliability rates in the industry. The finest components, connectors, and multi-layer PC board design, ensure years of trouble-free operation. We back all our products with a 90 day warranty and full technical support.

For more information on Baby Blue II and other line Microlog products, see your micro-computer dealer or contact us:

Courseware Design

Interactive courseware offers some educational options not available with books, pencils, and paper. Well-designed courseware makes the most of these unique opportunities.

When designing or evaluating computer courseware, educators need to consider a number of pedagogical factors that are unique to this medium. As I discussed in a previous issue (see "Courseware Basics," *PC*, Volume 3 Number 16), good educational software should have a well-organized menu system, personalized interaction with the learner, and a discreet, effective way to test the user about what he's learned.

This article offers some tips on courseware aesthetics and diagnostic feedback.

Clean Screens

If courseware is an electronic text, the CRT screen is the equivalent of a printed page. A cluttered display creates distracting visual noise. A good display format is more than just a pretty picture. A well-designed display organizes information in a consistent fashion so the learner's attention will always be drawn to areas on the screen where new information or instructions will appear.

Thus, certain sections of the screen should be reserved for certain kinds of information. A 25-line screen might be divided so that the top 2 lines display a header (title and page information), the middle 20 lines display text, and the bottom 3 lines display function key assignments and other instructions. The central

20-line text area can be subdivided so that questions always appear in the same area. Space within the text area can also be reserved for user input and feedback.

As if to emphasize the unique flexibility of computer-aided instruction, some courseware authors deluge learners with graphics, color, and sound. There's no doubt that special effects can energize dry facts, but the key is to apply them sparingly and with sensitivity. Like creative people who work with any medium, the author must be able to step away from his work, view it as the audience would, and then be willing to edit it dispassionately.

For example, as positive reinforcement, an author may reward successful

completion of a chapter with a burst of *son et lumière*. But how will this play in a ten-chapter lesson? How many times will the learner appreciate an inescapable reenactment of the climax to *2001*?

Flashing text, which blink to attract the learner's attention or to make a point, can backfire in two ways. First, in a machine environment, flashing is often used to indicate danger or caution. As a result, flashing text might agitate the learner. Second, a persistent flashing message is as irritating as an instructor who repeats a direction over and over. Instead of a benign reminder, it might be taken as an insult: "Got it yet, dummy?"

EDUCATION

Interaction and Feedback

Interactive courseware sets up a dialogue between the learner and the program. But computers are far less agile than humans in handling the ambiguities of communication, and thus it takes thoughtful design to manage this interaction.

When examining courseware, note how the program solicits and accepts user input. For example, some programs forgive capital letters, spaces, and punctuation in typed responses; others demand letter-perfect accuracy. In either case, rules governing how an answer should be entered should accompany the question itself.

In courseware, answers can be wrong for several reasons. Not only can they be *factually* wrong, they can also be *technically* wrong—"Washington, DC" may not be recognized as the U.S. capital if the author has stipulated only "Washington, D.C." as a valid answer.

When an answer is incorrect, diagnostic feedback that explains or suggests the possible cause for the error should be given. Some feedback is friendly but cryptic: "Sorry. Try again." Other feedback messages are phrased in language that blames the learner for what is a programming con-

straint: "Answer too long."

If the problem lies in the machine, more honest messages are appropriate—for example, "This program cannot handle responses longer than 20 letters." If the courseware author can offer more detailed diagnostic information to the learner at this point, a Help or Hint option is useful.

On the other hand, feedback can also be patronizing or embarrassingly cute. Often courseware will enthusiastically congratulate the learner for correctly typing his name ("Fantastic!"). Who is so insecure as to need this much support?

At the heart of the learner-computer dialogue is the computer's ability to evaluate a learner's response. Courseware uses various methods to control learner input and make it easier to judge. One method is limiting the characters the learner can type. For example, a true-or-false question might allow either a maximum of five characters in its answer or a single character ("T" or "F").

Another approach is to partially disable the keyboard and not display characters other than "T" or "F." The courseware should tell the learner if these techniques are used.

The swift judgment of a hair-trigger computer is awesome. No sooner is an answer entered than it is evaluated as right or wrong. This is fine if the learner never makes a typing mistake or has a second thought. But courseware needs to be forgiving of human nature and let learners initiate the judging process. One way of doing this is by inserting an extra step, a Confirm key that the learner can press to signal satisfaction with the answer.

A final point: Answer and feedback should coexist on the same display. It's disconcerting when a computer judges an answer that is no longer on the screen.

The Last Word

There are some indisputable earmarks of mediocre courseware. Look for page turners that require learners to do little but press the Enter key repeatedly, lessons with identical content for every learner, quizzes that never vary in format, and programs that blaze with sound and light but offer little substance.

Just because a lesson has been put on a CRT does not mean it belongs there. Courseware should offer value-added educational activities not easily achieved with books, paper, and pencils. ■

Happy! YES, AND YOU CAN BE TOO. He did not have to type in all his old data and programs. He used our package (FTP) and moved up to the IBM PC or T2000 and took everything with him. He used our File Transfer Program with conversion utilities and watched the computer work! Moving from APPLE, TRS, or CP/M machine to the IBM PC/XT/JR, T2000, or a compatible; **CALL US.** Our FTP can make you happy too!

PALANTIR™ WORD PROCESSING

WE DON'T HAVE TO BEEF UP OUR GUARANTEE WITH A LOT OF BULL

Other software companies give you disclaimers. Palantir gives you a real guarantee: Palantir backs its software with 90 days of free phone support via a toll-free number. When you call, we won't tell you to ask your dealer or read your manual; we'll answer your question, free of charge. If we can't solve your problem, we'll replace your Palantir Software with any competitive software of comparable value.

We couldn't make an offer like this if we weren't confident about Palantir word processing. It's easy to learn, easy to use, easy to live with.

Palantir word-processing software is designed for microcomputers. Yet it gives you all the features of a dedicated word processor. You won't find a better system on the market today.

To find out more about Palantir software, mark the reader-service card

in this issue or call, toll-free:
1-800-368-3797. In Texas, call
713-520-8221.

We'll respond with detailed information on Palantir software and a free "No Bull" button. A closer look will convince you that we're not just one of the herd. And that's no *bull*.

New On The Market

HARDWARE

Multifunction GPIB Controller

A plug-in board providing a means of controlling IEEE 488 GPIB devices and instruments from the user's system. The board can be connected to up to 15 devices for automated measurement and data acquisition applications.

In addition to its GPIB capability, the board has one programmable interval timer and one parallel port that will accept any one of several optional modules available from the manufacturer. Modules available include A/D and D/A converters, reed relays, and stepper motor controllers.

A separate software package supplies all of the routines needed to implement the board's GPIB functions. Over 30 macro

commands permit the user to perform many common applications. The user can use BASIC, assembly, or other programming languages to invoke the application routines.

(List Price: Board, \$395;

Modules, \$75-\$495;

Software, \$100)

RGB-1400PC Display

An RGB color display featuring 700-line resolution and the ability to display up to 32 colors simultaneously from a palette of 4,096 colors. The 14-inch CRT includes super-high contrast glass with a nonglare surface.

The internal circuitry of the monitor includes a Fujitsu MB14K series bipolar gate array that permits switching from an application program to built-in color balance calibration and test pattern functions. Provisions have been included to test color purity, red-blue convergence, and red-green-blue convergence. To reach these functions, the user simply activates a "test" switch located on the front panel of the display. Also accessible from front panel controls are color gain, brightness, power on/off, "on command" degauss, and color select from either

Multifunction GPIB Controller, Qua Tech, Inc.

HARDWARE

of two 16-color sets. Color selection is PROM controlled and can be easily changed; chosen colors are displayed in the Test mode.

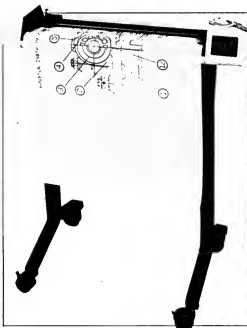

The design of the RGB-1400PC makes use of a transformerless isolation circuit that reduces the monitor's power, weight, and overall size requirements. Models of the display are available for 16kHz (compatible with IBM's color graphics board), 24kHz (compatible with Persyst's BoB board), or 31kHz (special CAD/CAM applications) operations.

SUPRETELEX PC

An internally mounted 600 bps modem with support software that emulates Telex/TWX network terminals, allowing data transmission through both domestic and international networks. The package features word processing capabilities to format messages with word wrap, text justification, word or phrase search, and so forth. Special message formats can be created and saved to disk for reuse. Included with the text formatter are the required formats for Western Union's Easy-

DMP-51 High Speed Plotter, Houston Instrument

Link electronic mail service.

The modem itself allows automatic dialing and redialing, delayed transmissions, and "refile" capabilities.

(List Price: \$695)
Requires: 96K RAM, one disk drive, PC-DOS 2.0, telephone line with RS-11C jack.

RECOUNT 400

A hardware/software package for office expense management. The system consists of a network of small data-entry, collection, and control terminals linked to a PC via a conventional

PCjr Pro-Kit, Prelude Corp.

communications interface.

The terminals are available in a variety of models featuring key or card entry, numeric only or alphanumeric capability, with or without integral printers. Terminals are also available for positive lockout control of office machines—copies, print machines, DP terminals, and fax machines.

RECOUNT 400 software includes the *TRACER* program that provides tailored menu-driven selection and supervision of all expense management operations. These include remote terminal data collection, transaction validation, and report generation. The system can also do cost extensions, and sorting/preprocessing for transfer to a higher-level host computer.

The RECOUNT 400 system can service up to 12 on-line terminals simultaneously, and any number of others in an off-line, store-and-forward mode. The system's hardware and software are available as separate components for users with existing PCs or as a complete turnkey system with a PC.

IRE Scrambler

A data-encryption device that provides secure data transfer over common phone lines when used in pairs. Computers equipped with matching devices and modems can communicate with each other free of unauthorized eavesdropping via the Scrambler's DES algorithm.

IRE Scramblers implement the Federal Information Processing Data Encryption Standard (FIPS 46) developed by the National Bureau of Standards. Each set of the devices has its own encryption key and can communicate only with other units in that set. When communications are established between members of the set, automatic session key distribution is performed and the units are synchronized. Null traffic and resynchronization are performed automatically during lulls in communication, so line use patterns are not apparent (a means by which transmission contents

might be found out).

The units support full duplex operation at the bps rate of the Scrambler model used. If the high-accuracy mode is selected, an error detection and correction algorithm is performed using a cyclic redundancy check word. If errors are introduced by the telephone system, the data are retransmitted until the check word indicates the data have been correctly received. This mode reduces the effective speed of communications but ensures that the data are delivered correctly.

Two models of the Scrambler are available: SC-12, offering bps rates of 300 to 1200; and the SC-96, offering 300 to 9600 bps. (List Price: SC-12, \$295; SC-96, \$495)

SOFTWARE

R WORD

A word and file processing system consisting of integrated programs for word processing, mail merge, table math, spelling, and database management functions.

To simplify document organization, a three-level file structure is utilized, containing 9 directories with 32 categories in each directory, and 32 documents in each category. The software al-

lows basic typing and filing tasks, as well as the production of more complicated documents with headers, footers, tables, and footnotes. Six editing modes are available to the user, including text, word, sentence, line, paragraph, and page. *R WORD's* color monitor support facility combines eight different color choices to use as background, reverse video, underlined or highlighted text.

(List Price: \$395)
Requires: 256K RAM, one disk drive, PC-DOS.

LABCODE-QC

A statistical quality control program that can produce

such control charts as p, c, X-bar, range, cusum, and other Shewhart-type charts. Up to 12 different sets of data can be plotted simultaneously, including the calculation of parameters such as the arithmetic mean, standard deviation, and minimum and maximum values. Data outside control or warning limits are immediately identified upon entry. Automatic trend analysis is also included.

Graphics, statistics, and data entry/editing facilities are integrated into the single system. User-defined equations can be set up within a data table to eliminate the need to do any calculations by hand and to minimize keystrokes. Function keys are labeled on screen, and help screens are available to simplify learning the system.

In addition to the main QC program, the system includes programs to create new data file formats, build custom help screens, and arrange graphs into slide show presentations.

(List Price: \$380)
Requires: 192K RAM, two disk drives, PC-DOS, color/graphics adapter.

We carry a full line of out sheet feeders and tractor feeders for all of our letter quality printers. Ask for prices.

NEXT MONTH we are celebrating our first birthday. We at Micro StoreHouse are proud of the reputation we have built. Our goal is to be able to provide high quality equipment at competitive prices. Our large inventory affords fast service for our customers.

AT LAST after eleven months we are finally up and running on a computerized inventory system. Finally we will be able to tell you almost immediately if an item is in stock or not. Be patient with us on those rare occasions we are out of stock. Unfortunately the market in the computer business changes so quickly that often manufacturers can't keep up with the demand for their products. Sometimes, a magazine review causes an unusual demand for a product. Either way, if we can't fill your order you can rest assured that we will send your merchandise as fast possible.

SHIPPING You will be charged the exact cost of shipping plus \$1.50.

CREDIT CARDS We accept Visa, MasterCard and American Express. No extra charge for credit cards.

CORPORATE AND LARGE QUANTITY ORDERS need special attention. Ask for a Corporate Account Representative. He or she will follow your order through the shipping and billing process to assure your satisfaction.

PC MAGAZINE • SEPTEMBER 4, 1984

QualityAlert

A statistical quality control program using eight control charts to analyze different aspects of a process' variable and count data. *QualityAlert* may also be used for process monitoring, pattern detection, and, to an extent, lot acceptance and monitoring.

Features include a data storage and edit capability, descriptive statistics, histograms, and a process capability study for variable data. The program assumes little prior computer experience from the user, presenting a series of menus from which to choose desired functions. Three data simulators can generate normal and binomial samples and Poisson-generated data.

Output graphs include three types of histograms, five charts for plotting variable and attribute data, and three charts for plotting defect percentages in attribute data.

(List Price: \$795)

Requires: 64K RAM, two disk drives, PC-DOS, color/graphics adapter, graphics printer.

Realia COBOL

A COBOL compiler that al-

Project, Microsoft Corp.

lows IBM mainframe VS COBOL programs to be compiled and tested on an IBM PC. The software allows programmers experienced in VS COBOL to use the PC for new program development without costly retraining.

Realia COBOL compiles at high speed using several optimization techniques to generate efficient code. Typical compilation speed ranges from 700 to 1,500 lines per minute on a floppy disk, 1,200-1,600 lines per minute on a hard disk. It accepts ANSI 74 COBOL with extensions derived from VS COBOL. Structured programming facilities from the proposed NASI COBOL standard have also been included.

Other features include a

cross-reference listing, an expanded code listing, a symbolic debugger, and a nonlicensed run-time library of functions.

(List Price: \$995)

Requires: 160K RAM, two disk drives, PC-DOS.

CIRCLE 779 ON READER SERVICE CARD

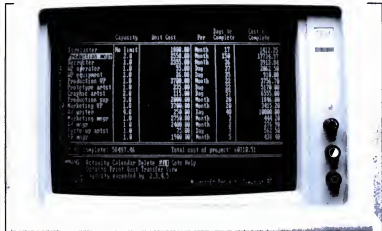

Project

A project-scheduling and management program that works much like an electronic spreadsheet program. Features include English commands, spreadsheet-style layout, individual resource and cost tables, graphic displays of schedules and resource usage,

and an extensive reporting capability.

The program's design allows the user to determine immediately the impact of any proposed changes to project schedules. The graphic display feature gives a visual schedule of activities, simplifying the identifying of critical and noncritical project areas. The included Resource Cost Table provides a summary of project costs through "cost-to-complete" data for any selected date on a schedule. The Resource Profile Chart displays graphically which project activities are using any particular resource, and when.

The built-in reporting facility can generate and print predefined reports, and specific reports detailing activi-

GCLISP, Gold Hill Computers, Inc.

ty and project status including early/late start dates and resource requirements/costs. Reports can also be transferred to outside programs such as *Multiplan*, *Chart*, *Lotus' 1-2-3*, and *dBASE II*. (List Price: \$250)

Requires: 128K RAM, one 320K drive, PC-DOS.

GCLISP

An extended subset of the Common LISP programming language for creating applications with artificial intelligence characteristics. GCLISP offers a full range of data types, including closures, co-routines, vectors,

multidimensional arrays, named structures, and single and double precision floating-point numbers. Closures can be used for object-oriented programming, and subroutines for multitasking. GCLISP includes an on-line help facility that documents every function and variable.

In addition to LISP language capabilities, GCLISP also supports several program development aids and operating system extensions, including a full-screen GMACS editor, random file access, macros, color and graphics, and stream-oriented Input/Output.

The complete GCLISP package includes a new edition of LISP by Patrick H. Winston and Berthold K. P. Horn and a training program called *Tutorial Smartware*.

Energy Accountant

A program that tracks the effectiveness of energy conservation efforts in building complexes. The *Energy Accountant* software can accommodate any fuel source and normalizes data for weather, facility size, and changes in energy systems. Other features include the pro-rating of fuel and utility bills to monthly consumption, and the ability to develop energy targets based on past performance. Up to

75 buildings can be handled on a floppy disk system, up to 200 buildings by using a hard disk.

The program also provides the user with an early warning of building system problems, identifies conservation opportunities and costly billing errors, prepares energy budgets and forecasts consumption, and can also establish energy objectives.

(List Price: \$1,000)

Requires: 128K RAM, two disk drives, PC-DOS, printer.

ACCESSORIES

Power Directors

A line of desktop power control and protection units containing expansion outlets, control switches, and line-conditioning circuitry. Each outlet is provided with its own labeled power switch on the front panel with individual pilot lights. All outlets can be controlled from a single Power Director master switch. The outlets are protected by individual surge suppressing and line noise filtering circuitry, and a circuit breaker safe-

ACCESSORIES

guards against problems caused by equipment overload.

Three models of Power Directors are available. Standalone model P22 offers four outlets and is sized to stack with disk drives, modems, or small video monitors.

Monitor-based model P2 offers five outlets and is designed to fit under a standard-sized monitor.

Model P12, the largest of the three, offers six outlets, a digital clock, and a diskette storage bin. It is intended to fit on top of the IBM PC's systems unit. (List Price: P22, \$99; P2, \$139; P12, \$199) Computer Accessories Corp. 7676 Formula Pl. San Diego, CA 92121 (619) 695-3773

Guide to Accounting Software

An analysis and comparison of selected accounting packages from BPI Systems, Champion Software, Great Plains Software, Peachtree,

and others. The systems chosen represent a range of capabilities and are in wide use. Functional modules reviewed for each system include accounts payable and receivable, general ledger and financial reporting, inventory control, sales order processing, and job costing.

A Guide to Accounting Software for Microcomputers is organized with a 90-page discussion of the systems selected for review, 12 pages of features analysis comparing each system by functional areas covered, and 35 pages of detailed comparative charts covering all elements of the master files, all transaction components, audit trail support, and reports. At a more general level, there is also an

analysis of the systems by applicable industries and company sizes and by file capacities. Also included is an extensive glossary of terms.

New on the Market Submission Guidelines

1. Please include the retail price, distribution methods, and details of both hardware and software requirements needed for an end-user to properly use your new product. For software especially, this includes required amount of RAM, number and type of disk drives, operating system(s) supported, and any peripheral equipment needed.
2. Releases should be typewritten double-spaced on one side of the paper. Copies of advertisements for the product may be included, but in most instances we need more information about a product than is typically included in an ad.
3. Include telephone contacts for marketing and technical questions.
4. If available, include black & white glossy photos of the product, 4 x 5 in. or larger.

Please note that all products are run on a space available basis. It is impossible to guarantee publication of a product announcement for any particular issue.

Inclusion in **New on the Market** is at the exclusive discretion of the editors.

Dysan[®]

CORPORATION

SPECIAL DISKETTE OFFER

Dysan diskettes are the ultimate in quality flexible recording media for flexible disk drives. They are certified to be 100% error free on-track and between tracks. Diskettes are tested on-track as well as between tracks for missing pulse, extra pulse, and modulation. Quality is built into each diskette from the inside out. The ultra smooth disc surface is burnished on both sides to promote longer media life, longer head and load pad life, as well as better recording and playback performance. And to help introduce you to the Dysan quality standard we're running a special on their diskette product line.

PLUS! If you call, write, or utilize reader service in response to this ad—we'll send you our full-range catalog of computer supplies with special Offers good for further savings on Dysan diskettes and many other quality products.

If you use DOS, you need this program.

Do a DIR. Look at the size of your program files. You are seeing wasted space. The **Realia Spacemaker™** shrinks your COM and EXE files. No more wasted space.

How it works: Uninitialized (binary zero) areas are compressed, and the relocation entries are eliminated. When executed, the program expands and relocates itself, recreating the original program.

Realia Spacemaker™ \$75 (ppd.)

Talk to DEC® equipment? Use the Realia Termulator™. Full VT100/VT52 emulation and file transfer capabilities.

PC DISK
MAGAZINE

...The low-cost
and efficient way
to build a library
of software
programs!

These are some of the
programs and applications you will
have at your fingertips to expand your IBM PC:

Now you can build a library of software programs with amazing ease and at amazing savings! Imagine, adding to your home a library of utilities, sub-routines, games and data files for as little as \$3 per program! PC DISK MAGAZINE, a new concept for your IBM PC gives you this and much more!

Every issue you get is a thoroughly tested, ready-to-run floppy disk with up to 8 programs, accompanied by a fully illustrated user manual.

ALL YOU HAVE TO DO IS INSERT THE FLOPPY DISK AND GO!

Subscribe today and save up to \$60 for your order of PC DISK MAGAZINE! Send us the full payment by check, money order or credit card and save an additional 10%.

**ACT NOW...SAVE MONEY
AND BEGIN YOUR SUBSCRIPTION
TO PC DISK MAGAZINE TODAY!**

Product Specifications:

- Programs will run on IBM PC, XT, AT, PCjr, and most compatibles under PC-DOS and MS-DOS versions 1.1, 2.0, and 2.1, requiring a minimum of 64K under DOS 1.1 and 128K under DOS 2.0 and 2.1.
- Most programs will be written to run on monochrome and color display; however, some games and utilities may be developed for color display only. (Monitor vs. TV recommended)
- Most programs will be written in advanced BASIC; however, some machine language and compiled code may be used.
- All disks are fully tested and guaranteed to run. Damaged or faulty disks will be replaced at no charge.
- All programs and documentation are copyrighted by Ziff-Davis Publishing Company. All rights or reproduction in all forms and media strictly observed. We guarantee full satisfaction!

BUSINESS AND FINANCE AIDS: Advanced pie, bar and line chart graphics...compute loan payment tables...calculate the Present Value and Internal Rate of Return for investments...Visualc® templates for Real Estate, Lease/Purchase and Tax Shelter Analysis.

HOME/PERSONAL PROGRAMS: Income tax return helper...maintain mailing lists...personal cash flow analyzer...speed reading training...SAT test preparation aids...games of dexterity, skill and MORE!

UTILITIES AND DIAGNOSTICS: Print graphics and screen images...simulate a conversational terminal...sort files...transfer files to or from another computer...diagnose and correct problems!

ALL THIS FOR AS LITTLE AS \$3 PER PROGRAM!

TOTAL CONTROL: PC/FORTH™

Compiles with the New 83-Standard
GRAPHICS • GAMES • COMMUNICATIONS • ROBOTICS
DATA ACQUISITION • PROCESS CONTROL

- **PC/FORTH™**: interactive and conversational, but 20 times faster than BASIC.
- **PC/FORTH™** programs: highly structured, modular, easy to maintain.
- **PC/FORTH™**: direct control over all interrupts, memory locations, and I/O ports.
- **PC/FORTH™**: full access to DOS files and functions.
- **PC/FORTH™** application programs can be compiled into turnkey COM files and distributed with no license fee.
- **PC/FORTH™** Cross Compilers available for ROM'ed or disk based applications on most microprocessors.
- **PC/FORTH™**: compatible with PC/XT, COMPAQ, and all hard disks.
- **PC/FORTH™**: for PC-DOS 1.1 and 2.0, CP/M-86®, Concurrent CP/M.

Trademarks: IBM, International Business Machines Corp.; CP/M, Digital Research Inc.; PC/Forth+ and PC/GEN, Laboratory Microsystems Inc.

PC/FORTH™ \$100.00
Includes interpreter/compiler with virtual memory and background multi-tasking, full screen editor, Assembler utilities, 200-page technical manual. Upgrade to PC/FORTH+ available.

PC/FORTH+™ \$250.00
Allows creation of FORTH programs up to 1 megabyte in size.

DEMO DISK \$5.00
Requires graphics card.

Drowning in a sea of solutions?

Help's within reach...

Applications backlog. Technology blur. Mounting user pressures. Staying abreast of changing prices. A tidal wave of problems!

Even if some answers are available, you have to go to too many sources and sift through so much information, there's not enough time to locate the solutions to your immediate and most important problems.

Well, help IS within easy reach—in the form of an information system that displays all your current software, hardware and communications options for instant reference.

That system is DATA SOURCES, and you're invited to make it work for you. Simply fill in the coupon and we'll send you DATA SOURCES 4 quarterly editions at 33% off their regular price.

What DATA SOURCES does is organize your options. It guarantees that you've considered all relevant products by guiding you to those with the best possibility of success.

DATA SOURCES is a conveniently sized, extremely well-organized and skillfully indexed 2-volume reference... maintained on a data-base, constantly updated and published quarterly

YOU GET...

HARDWARE—Over 16,000 products from Micros to Mainframes including peripherals—terminals, printers, memory devices, etc. ...organized by systems compatibility

SOFTWARE—The largest available inventory of 18,000 business packages for micros, minis, and mainframes including operating systems, utilities, and application packages.

COMMUNICATIONS EQUIPMENT—From modems and multiplexors to local networks, carriers and services, plus all diagnostic and test equipment.

SERVICES, SUPPLIER, SUPPORT—Most complete organized listing of suppliers from installation design to maintenance and data center operations—over 8,000 companies.

NEW FEATURES...

- ✓ **Software Index**—by package name.
- ✓ **Quick-reference product comparison charts.**
- ✓ **Before-you-buy selection criteria and checklist.**
- ✓ **Product Hotline**—the very latest information on products announced between issues of Data Sources.

Writing In dBASE II

Here are two useful programs to help you harness the power of dBASE II for specific applications.

In last issue's Programming column, "Tips on dBASE II" (PC, Volume 3 Number 16), I described some techniques to use when writing dBASE II command files. This issue's column will continue that discussion and provide instruction on how to automatically invoke a command file. It also includes an extended program for unloading comma-delimited databases from dBASE II to programs such as MailMerge.

Automatically Executing a Command File

My firm, Darwin Systems, Inc., runs dBASE II applications on a variety of machines that operate under CP/M-80 and PC-DOS/MS-DOS. Our CP/M-80 machines do not have an internal clock/calendar, but we require that all DBF files be stamped with a date that correctly corresponds to the last update. Our solution is to automatically execute a command file, DATE.CMD, that ensures that the system date has a valid value any time dBASE II is invoked. (DATE.CMD is itself an interesting program that retains the system date until the machine is turned off, regardless of how many times a user goes in and out of dBASE II during the day.)

To make dBASE II automatically execute a command file on invocation at the operating system level, all we have to do is place the name of the command file at a

memory location beginning at 80H and put a JMP instruction at the beginning of DBASE.COM to the short routine that places the command file name at 80H. In Version 2.4, dBASE II starts off with a JMP 46C9 instruction; we replace this with something like JMP 4D00, and at 4D00 patch in a routine that places the name of the command file at a memory area beginning at 80H. This routine should end with a JMP 46C9 instruction.

The patch is done with DDT. If the command file we want to execute automatically is DATE.CMD, the steps are as shown in Figure 1.

Automatic execution of a command file is also useful for end users who want dBASE II to execute one (and only one) command file. For example, a user who wants dBASE II to execute TRAV-

FAST SIDEWAYS PRINTING FOR YOUR EPSON

Now you can print multi-page **spreadsheets** or reports as wide as you like on your FX printer, **sideways** on your paper, in a choice of five different type sizes, at **full text-mode speed**. And you can print in super-fast two-pass dot-matrix **letter quality**. Or create a printer buffer up to 32K.

Printer Boss™ software also allows full menu-based operation of all control functions of all of the Epson MX, FX and RX printers. **Select** and **deselect** pica, elite, compressed, italic, enlarged, emphasized, doublestrike, underline, superscript and subscript. **Set** line spacing, right and left margins and skip-over-perforation. **Load** USA, France, Germany, England, Denmark, Sweden, Italy, Spain and Japan language sets. **Control** unidirectional, half-speed and proportionally-spaced printing. **Store** and **retrieve** 10 complete menu settings with a few keystrokes. **Emulate** the IBM-label printer for the IBM-PC, eliminating character print-out incompatibilities between IBM-PC software and Epson FX printers while retaining full printer versatility. **Download** to FX printers five different **IBM character sets**, including graphics symbols, greek symbols, screen and APL characters. Print at full text-mode speed. **Ideal for IBM graphics** software, or **screen dumps**, or printing text from **Wordstar**, **Lotus 123** or many other fine programs.

Printer Boss™ for the IBM-PC and compatibles \$59.95. With Letter Boss™ letter quality or Sidekick™ sideways print option \$99.95. With both \$139.95. Visa, MC, or send check. Free info. Dealers welcome.

PROGRAMMING

EL.COMD or TRAVEL.PRQ only can patch in TRAVEL and rename DBASE.COM to TRAVEL.COM.

dBASE II to MailMerge

This discussion would not be complete without tackling the subject of passing data from *dBASE II* to *MailMerge* and other software. Some programmers suggest using the COPY TO .. SDF DELIMITED WITH command and then either using *WordStar's* global find-and-replace facility or a BASIC program to get rid of trailing blanks. This was necessary in earlier versions of *dBASE II*, but Version 2.4 works without any additional effort. The command

```
COPY TO<filename>
SDF DELIMITED WITH"
```

unloads the database records correctly without trailing blanks, and it can be used directly by *MailMerge* and others without any massaging.

The program that appears in Figure 2, DB2MM.PRQ, uses this command and other *dBASE II* trickery. The program is a general one that allows the user to do the following:

- specify the name of the DBF file (the program then obtains the file's fields via the COPY STRUCTURE EXTENDED command);
- select any or all fields of the database to be included in the *MailMerge* file;
- specify a set of selection criteria so that only those records satisfying the criteria will be included. To guide the user in formulating the criteria, a brief example is given and a list of all character and numeric fields in the database are shown on the screen.

The DB2MM.PRQ program includes various error traps which were inserted to prevent an abnormal termination. These error traps include the FILE function to check for the existence of the specified DBF file, and the TEST function to test for

Figure 1: The listing for the DDT patch that makes *dBASE II* automatically execute a command file. All user input is in lower case. Author's commands are on the right separated by arrows.

PROGRAMMING

the validity of the selection criteria.

The program also illustrates one way of writing command files: all *dBASE II* keywords are in uppercase, while all others (memory variables, field names, filenames) are in lowercase. IF-ENDIF and DO-ENDDO blocks are indented—I al-

ways try to mark ENDIF/ENDDO statements with identifiers to indicate which blocks they are ending.

With the tips contained in this article and its predecessor, writing *dBASE II* run-time applications ought to be much less confusing. ■

IF f

DB2MM.PRG (c) 1983 Darwin Systems, Inc.

AUTHOR: P. L. Olympia, Ph.D. -12/10/83-

PURPOSE: General system for converting dBASE II data into a format usable by MailMerge, DataStar and others

FEATURES:

- o No limit on the number/length of fields to be converted
- o User specifies DBF file during run-time
- o User can specify any or all fields contained in the DBF file
- o User can specify selection criteria that records must satisfy for their fields to be included
- o Built-in error traps via FILE and TEST function to prevent abnormal termination.

NOTES:

- o COPY STRU EXTE TO filename will create "filename" whose records are the fields of the DBF in use
- o Version 2.4 of dBASE II allows the COPY TO <filename> SDF DELI WITH " command to unload a data base with trimming of trailing blanks

PSYCHE™ THE COMPUTER COUNSELOR

ARTIFICIAL INTELLIGENCE. PSYCHE is a modern software simulation of a Rogerian counselor who will hold a delightfully real keypunch conversation with you on over 50 subjects including marriage, sex and work. You type anything you wish. PSYCHE analyzes your remarks and creates responses that are reflective, non-directive and nonjudgmental. PSYCHE usually stays with your feelings like a real therapist, has unlimited time and patience, and never judges you or hands out advice.

REALISTIC. Thanks to 1984 techniques, responses are compressed, lively and on the subject. You can catch yourself thinking of PSYCHE as a real person.

ENJOYABLE. Tell PSYCHE anything. PSYCHE always listens and never guesses. And PSYCHE really shows off your computer, even greeting your friends by name.

NOT A GAME. A state-of-the-art full-scale simulation with over 156K program and files, PSYCHE knows over 1,500 key words and responses.

TEACH PSYCHE MORE. Comprehensive menus let you easily improve both vocabulary and responses, or add whole new subjects, without programming. PSYCHE even lists unrecognized words so you can add them. Conversations can be saved and printed. Includes 12 page manual.

TEXT

You may impose any selection criteria to preselect any
records that should be included in the MailMerge file.

An example of a selection criterion is:

NAME >='A' .AND. NAME <='B'

where "NAME" is a field in the data base. This criterion will
select only those records with Names beginning with A or B.

FAST LETTER QUALITY FOR YOUR EPSON

Now you can print **letter quality** on your Epson FX printer at **full text-mode speed**, up to 10 times faster than with programs using graphics mode. **Printer Boss™** software gives you **two-pass dot-matrix letter quality** and lets you create a **printer buffer** of up to 32K. Or print multi-page **spreadsheets** as wide as you like, **sideways** on your paper, at high speed, in a choice of five different type sizes.

Printer Boss™ also allows full menu-based operation of all control functions of all of the Epson MX, FX and RX printers. **Select** and de-select pica, elite, compressed, italic, enlarged, emphasized, doublestrike, underline, superscript and subscript for scores of different faces. **Set** line spacing, right and left margins and skip-over-perforation. **Load** USA, France, Germany, England, Denmark, Sweden, Italy, Spain and Japan language sets. **Control** unidirectional, half-speed and proportionally-spaced printing. **Store and retrieve** 10 complete menu settings with a few keystrokes. **Emulate** the IBM-label printer for the IBM-PC while retaining full printer versatility. **Download** to FX printers five different **IBM character sets**, including graphics symbols, greek symbols, screen and APL characters. Print at full text-mode speed. Ideal for **IBM graphics** software, or **screen dumps**, or printing text from **Wordstar**, **Lotus 123** or many other fine programs.

Printer Boss™ for the IBM-PC and compatibles \$59.95. With Letter Boss™ letter quality or Sidekick™ sideways print option \$99.95. With both \$139.95. Visa, MC, or send check. Free info. Dealers welcome.

**To communicate voice
the ordinary modem**

and data simultaneously, leaves a lot to be desired.

Introducing the Tel-A-Modem.

Now you and your personal computer can talk on the same phone at the same time.

Let's say, for example, certain data you were transmitting via your personal computer to a remote computer user needed some verbal explanation to go along with it. With the ordinary modem it couldn't be done. Not simultaneously.

You'd have to first call the user to inform them that data was coming. Hang up. Redial in order to connect modems. Transmit the data. Hang up. And then call back with your explanation. If you had additional input to transmit and discuss, you'd have to begin the whole process again. Talk about frustration.

Code-A-Phone's solution to this problem is the Tel-A-Modem. An innovative two-line desk telephone integrated with an intelligent modem capable of transmitting voice and data simultaneously.

Of course, the genius of Tel-A-Modem doesn't end with its unique communication capabilities and state-of-the-art convenience.

Specially designed for use with RS-232C compatible computers and terminals, it offers a full spectrum of both telephone and modem cost effective features, including: single button selector for voice or data on either line; full-duplex mode; automatic answer/origi-

nate modes; 300 and 1200 baud data transmission rates; automatic selection of baud rates; switch dialing for tone-dial or pulse-dial systems; memory autodial; and modem status LEDs.

So much for words.

For more information and the name of your nearest Tel-A-Modem dealer, call 1-800-547-4683. That is, just as soon as your computer gets off the phone.

In Oregon, Alaska and Hawaii, call 1-503-655-8940.

**New Release
4.1**

We've continually improved Microstat since it was introduced in 1978, and the latest release includes many new features you've wanted.

Interactive and Batch Processing
Expanded Data Management
Subsystem with New Data
Transforms
Reading data files created by other
programs
3 types of Analysis of Variance
Time Series
Crosstabs and Chi-Square
Factorials, Permutations, and
Combinations
Hypothesis Tests

Data sets that can exceed memory
Multiple Regression (Including
Stepwise)
Scatterplots (including best fit
regression)
Correlation Analysis
12 Nonparametric tests
8 Probability Distributions
Descriptive Statistics
Easy Installation

Microstat's algorithms have been designed to prevent numeric overflow errors and yield unsurpassed accuracy. Microstat's price is \$375.00 including the user's manual and is available for the 286, 8086, 8088 CPUs and CP/M86, CP/M86, MS-DOS, and PC-DOS. To order, call or write.

6413 N. College Ave. ■ Indianapolis, IN 46220
(317) 255-6476

Trademarks: Microstat (Ecosoft), CP/M (Digital Research), MS-DOS (Microsoft), PC-DOS (IBM), Zilog (Zilog), 8086, 8088 (Intel).

COMING UP

A Member of the Ziff-Davis
Family of IBM PC Magazines

Read All About It

We'll have full coverage of IBM's plans for the PCjr, which could turn your Junior into a dream machine.

Scholastic Achievements

IBM advances into the education market, with Junior at the head of the class. We'll look at IBM's lesson plans and test new education software for students and teachers.

King's Quest

Could this be the world's greatest computer game? Rich in color, fluid in movement, and full of medieval magic, this animated adventure is unlike anything in the computer kingdom.

Stock Market

A look at the Dow Jones/News Retrieval Service, a communications network that'll help you separate the bulls from the bears on Wall Street.

Whiz Kids

Baby Boomers are crazy about computers and nobody wants their kids to be left behind. But how young is too young to introduce your child to the PCjr?

Columns

The Editor's Wire by Corey Sandler;
Junior Explorer by Peter Norton;
Screen Play by Don Kennedy; Opinion by Lindsay Van Gelder; Education by Martin Porter; Looking at Logo by Winn L. Rosch; It's BASIC by John M. Worum; Communications Networks by Eric Freedman; Reader to Reader by Paul Somerson; The Product Line.

PC MAGAZINE • SEPTEMBER 4, 1984

EDITED BY PAUL SOMERSON

User-to-User

PC readers use this forum to help one another by passing along their questions, solutions, comments, and complaints.

The following letters all contain hints and tips about 1-2-3. PC thanks 1-2-3 expert David Hoffman for his help in evaluating these letters. Hoffman is president of Abacus Productions, Inc., a New York City

firm that provides production and consulting services to the motion picture industry. The comments that follow are his.

Print Macros for 1-2-3

Since I first started working with macros for printing with Lotus' 1-2-3, I have intended to set up a list showing the available print fonts and their associated control codes. I have finally taken the time to do it and the response has been so good I thought your readers might like to have a copy (see Figure 1).

A word of explanation: I realize some of the control codes don't require the Escape (ASCII 027) code (the ASCII 015 control code, for example); however, using it doesn't affect the string, and, especially for the beginner (or for the user who doesn't use control codes that often), it is easier just to put it in front of everything.

I have also included a copy of the macro I used to print the font list. Many of my business associates now using the list find it to be a good reference in writing their own programs.

The list was not intended to be all-inclusive. In fact, as soon as I printed it, I thought of more that could have been added, but it's enough to get started.

Ed Scott
Huntington Beach, California

Though I don't quite agree with the logic of using unnecessary Escape characters (a few extra ASCII 027s don't make weird numbers any less weird), this is a job that needed to be done and it's nice to have it all in one place. Enter these magic codes while using an Epson/IBM dot matrix printer and the /Print Printer Options Setup command.

Recalculation Beeps

I have several very large worksheets with

ELIZA IS HERE!

AT LAST! A FULL IMPLEMENTATION of the original ELIZA program is now available to run on your IBM Personal Computer!

Created at MIT in 1966, ELIZA has become the world's most celebrated artificial intelligence demonstration program. ELIZA turns your computer into a non-directive psychotherapist with whom you can converse much as you would with a live therapist. She analyzes each statement as you type it in and then responds with her own comment or question. Response time is virtually instantaneous, and her remarks are often amazingly appropriate! Designed to run on a large mainframe, ELIZA has never before been available to personal computer users except in greatly stripped down versions lacking the sophistication which made the original program so fascinating.

Now, our new IBM PC version possessing the FULL power and range of expression of the original is being offered at the introductory price of only \$25. And if you want to find out how she does it (or teach her to do more), you can buy the complete IBM Disk BASIC SOURCE PROGRAM for only \$20 additional. Order your copy of ELIZA today and you'll never again wonder how to respond when you hear someone say, "Okay, let's see what this computer of yours can actually do!"

AVAILABLE ON DISK IN TWO VERSIONS FOR THE PC

1. Protected Version \$25
(Protected Version can be run but not listed or modified)
2. Un-protected IBM Disk BASIC Source Version \$45
(Source Version can be listed and modified as well as run)

Both versions include a six page user manual. Please add \$2.00 shipping and handling to the above.

(California residents please add 6% sales tax)

USER-TO-USER

numeric calculations set up on Lotus' 1-2-3 and on which a recalculation takes several minutes. In order to start recalculation and leave the machine unattended, I need to know when the recalc is done so I can return to work. I discovered this trick: After starting the recalculation, press the Home key, then PgUp five or six times. The buffered keyboard saves everything subsequent to recalc until that is done, and then executes Home and PgUp. Since the cursor is moved to the top of the worksheet by Home, the PgUp causes 1-2-3 to beep, thus notifying you that the recalculation is finished.

Peter Fox
Chattanooga, Tennessee

Good trick, I use it all the time myself.

System Disk Trick

Here is a tip for users of Release 1A of 1-2-3 on hard disks who do not like to get out their system disk each time they boot 1-2-3. The trick does not work if you load the Lotus Access System before loading 1-2-3. From the DOS prompt (or in your

AUTOEXEC.BAT file) simply type:

123

and hit Enter. When the 1-2-3 copyright notice appears, place a blank, unformatted diskette into the A: drive and press any key. The blank 1-2-3 spreadsheet appears and away you go. This saves wear and tear on your system disks.

Steve Smiley
Gainesville, Florida

*My tests show this worked with Lotus Access System as well, though not at all with versions of 1A marked with an * on their copyright page.*

Multifile Macros

Spreadsheet users can work on two or more files interactively by adding a simple keyboard macro to each file.

The 1-2-3 example shown here uses two files: FILEA and FILEB. The macro added to FILEA is

/FSFILEA~R~/FRFILEB~~

When this macro is invoked, FILEA is

```

For the IBM® PC or XT, supports all printers — specify make and model number when ordering — requires 150K, 80 column screen, 5.5 drive — compatible with PC DOS 1.10, 2.00, 2.10 — compatible with most spreadsheets and word processors. Next day shipping on VISA/MC orders — price includes domestic shipping and handling — no extra charge for VISA/MC — MD & NM residents add sales tax.

CIRCLE 353 ON READER SERVICE CARD

How to teach your kids about the IBM PC.

Computers for Kids teaches children age 8 and older to write their own programs in less than an hour—without the necessity for previous knowledge of algebra, variables, or computers. And there's a special section that keeps parents and teachers on the same successful command path.

Starting off with an easy-to-understand explanation of how to use the IBM PC, your kids will progress quickly to flow charts and simple print programs...to loops, graphics, and other programming concepts that show the young user how to make the PC do exactly what he wants—in non-technical language that makes life easier for both of you.

So do your children a favor.

Do yourself
a favor.

PEEKing at Ports

Q: I have three questions, all involving BASIC.

1. My system has a dot matrix printer connected to parallel port 1 and a plotter connected to parallel port 2. Is there any way I can use BASIC to direct output to a particular parallel port?

2. Is there a BASIC routine that checks if the printer is on-line?

3. I recall seeing a BASIC routine for toggling the NumLock key on and off. Could you provide a listing of it?

Gary Swindell
Bridgeport, Texas

the following routine, which examines the LPT1: port.

```
10 DEF SEG=&h40
20 PORT% = PEEK(8)+256*PEEK(9)
30 REM for printer 1
40 STATUS% = &h00 AND INP(1=PORT%)
```

If STATUS% is not 0, then the printer is on-line.

3. To check the status of the NumLock key, use a similar subroutine. There's a byte at 0040:0018 with information on which shift keys are currently depressed. Another byte, at 0040:0017, describes which shift keys have been toggled. To find out whether the keyboard is in NumLock mode, use this routine:

```
10 DEF SEG=&h40
20 TOGGLE% = PEEK(&h17)
30 IF (TOGGLE% AND &h20) THEN ...
```

The IF statement in line 30 is true if the NumLock key has been pressed.

If you want to check on the status of other toggling keys, you can examine the relevant bits by using the following hexadecimal values where &h20 appears in line 30:

```
80 Ins key
40 CapsLock key
20 NumLock key
10 ScrollLock key
```

A: The solution to each of your questions involves examining the IBM BIOS' data area at hexadecimal address 400. (In BASIC's DEF SEG statements, remember that the last zero is omitted, so this address is written as &h40.)

1. In order to switch between your printer and plotter at the different parallel ports, you need to change the internal pointers for the hard-copy devices. The following routine switches the two pointers around:

```
10 DEF SEG=&h40
20 REM the BIOS data area
30 FOR J=&0 TO 9
40 I = PEEK(J)
50 POKE J, PEEK(J+2)
60 POKE J+2, I
70 NEXT J
```

The two pointers are located at 0040:0008 and 0040:000A. Each pointer is 2 bytes long. Each time this routine is run, the first pointer toggles between 0 and 188, while the second pointer toggles between 0 and 3.

2. To check if the printer is on-line, you need to examine the status bits from the parallel printer port. Normally, it's better to ask the BIOS for the status or to trap BASIC messages regarding the printer, but if you must check the port directly, try

PC TUTOR

I find it amusing that IBM devoted a bit to show the status of the ScrollLock key even though it does absolutely nothing as a toggle in the PC operating environment. I wonder why this key wasn't actually used to halt scrolling of the display?

Uneven Spacing

Q: When I use my Silver-Reed EXP 550 printer with WordStar, I notice problems with extremely uneven spacing between characters. Also, characters do not align from one line to the next. I know the printer is capable of better results than this, because it spaces words perfectly when I run Lotus' 1-2-3.

The installation program for Version 3.3 of WordStar doesn't list my Silver-Reed printer; MicroPro suggested I install it like the Diablo/Xerox 1610 printer. Is there another way to install WordStar so that characters will print out with even spacing?

Barbara Carlson
New York, New York

A: The problem probably involves microspacing. Many word processing programs take complete control of a printer, even to the point of adding tiny spaces between characters and words.

To deactivate the microspacing, try installing the Silver-Reed as a printer with no special features, an option that's sometimes called the "vanilla" printer. This is probably the way 1-2-3 treats your printer, and, if you like those results, you should find WordStar will do the same.

Lagging Memory Chips

Q: I have a PC-1, IBM's early model PC that holds only 64K RAM on the system board. I've added a 256K memory board, which raises the available memory to 320K, and now use DOS 2.1. I have several questions relating to my system's additional memory.

1. The add-on memory board originally had 64K. Later I installed 192K worth of RAM chips. I remember you once cautioned users to get Mostek's 4164 memory

chips with 200 nanosecond (200 ns) response. My local distributor sells Mostek 4164-300 chips. When I told him I needed 200-nanosecond chips, he claimed that the "300" suffix was Mostek's code for its 200-ns chips. This labeling seemed

Many word processing programs take control of a printer, even to the point of adding spaces between characters.

implausible, but I bought the memory anyway. Did I get the right chips—or did I get taken?

2. If the 4164-300 chips aren't as fast as 200 ns, what problems might arise with them in my system? I have used them for about a year with no sign of problems—until recently. I started using a word processing program that can use more than 128K. When I use this program with long files, there seems to be a significant delay between when I press a key and when the character appears on the display. The program's maker told me I'd be sent a faster, new version, so the problem might be caused—and solved—by software. But could this time lag be due to slower memory chips?

3. I recently purchased Lotus' 1-2-3, a program that can use more than 128K. After I spent several hours working on a file, I tried to save it, but the program was interrupted by a "Parity Check 2 Error"—and I lost the file. I never had a parity error before. Perhaps this and other recent problems occurred because I'm only now using memory blocks greater than 128K and starting to tap the 192K of suspect chips. Was the parity error a tran-

PC TUTOR

sient problem, or is it directly related to the chips?

4. I'd like to add another memory card to bring the PC's memory up to the maximum, but I've heard conflicting reports of what the maximum possible RAM is in a PC. The exact amount seems to depend on such things as whether the machine is a PC-1 or a PC-2 and which version of DOS is used. Is there a simple way to tell how much memory I can install?

Glen Nichols

Westlake Village, California

A: I'll treat your questions in order.

1. Many chip manufacturers use a numeric code that indicates the relative speed of different models of the same IC. A chip with the suffix -1 is the fastest, -2 is the next fastest, and so forth. Mostek, however, seems to buck that trend. According to listings in IC Master/IC Update (published by United Technical Publications, Inc.), Mostek identifies its 4164-20 as a 200-nanosecond chip. IC Master didn't even list a 4164-300, but my guess is that the chips you were sold are rated as only 300 nanoseconds. To find out if your chips aren't up to the PC's standards, try running a good memory test program, such as the one on IBM's Diagnostic disk. (The memory check that the PC performs at power-on is a more primitive test that is designed to detect hardware failures rather than dynamic errors that would reveal slow response times.)

2. If the chips are not fast enough, you can expect sporadic parity check errors, but programs will run at full speed. Program speed is a function of the IBM PC's clock speed, which isn't related to the response speed of memory chips at all. Memory chip speed refers to the maximum time a chip needs to respond to a request for data. If a chip can't respond fast enough, the data stored in it will be inaccurate and the PC will detect a parity error. (Computers that don't use the parity bit, such as the Eagle PC, won't stop to indicate a parity error—they run until you notice that some numbers in a spreadsheet

are wrong or that improper instructions cause a program to crash.)

3. It sounds as if you've uncovered the problem with your extra memory by running Lotus' 1-2-3. You're finally making use of the inferior chips in higher memory.

4. Yes, the maximum possible memory does depend on what model of IBM PC you use and which version of DOS you run. In terms of hardware, the limit is 704K because segment 0B000 is reserved for the IBM Monochrome Display Adaptor: 0B000 hex = 704 decimal (11 x 64). The amount of memory that you can put to work can be greater, however, by using bank switching.

Some programs can't support the full 704K—for example, a bug in early versions of DOS causes DISKCOPY to gag on a system with more than 512K.

On the PC-1, there's no way to indicate that more than 576K is installed, so it's unlikely that most programs will be able to use more than that on your machine. Some RAMdisk programs do search for addi-

The maximum possible memory depends on what model PC you use.

tional memory on the PC-1; since extra memory is usually used for RAMdisks, a full 704K could be useful to you after all. Be careful, though, since some of these RAMdisk programs don't know enough to stop at 704K and will try to use the IBM Monochrome Display Adaptor's segments as a RAMdisk since there's no gap between addresses in that area and the user memory.

The PC Tutor solves practical problems and explains points of general interest. If you'd like to see your questions answered here, drop a line to PC Tutor, PC Magazine, One Park Avenue, New York, NY 10016.

PC 1

HOW TO GET EVERYTHING OUT OF YOUR IBM PC THAT IBM PUT INTO IT.

At one time or another, we've all listened to some "expert" advice. But when you're dealing with something as advanced as the IBM PC, word-of-mouth advice just won't do.

That's why you need Vencompass Knowledge Systems. One-on-one, color video cassette instructions that teach you everything about your IBM PC. With instant playback capabilities that let you view any section over and over again.

Each of the Vencompass, Inc. Knowledge Systems video cassettes was written and created by some of the most knowledgeable experts in their field... the Panel of Excellence. Three members worked together on the IBM PC video cassettes to ensure that every point is raised and explained.

Thomas L. Venable, Chairman of the Board and President of a small public international electronics company, worked closely with Russell J. Forquer, Account Marketing Representative for the IBM Corporation, to integrate the IBM PC into the day to day systems procedure of his five manufacturing facilities.

Venable's expertise in computer systems procedures has been described in *Forbes Magazine* and the *Wall Street Journal*.

Jon VanAmringe uses the IBM PC on a daily basis to assist him in project analysis, materials planning, word processing and budget applications. Mr. VanAmringe has the responsibility for monitoring the continuing IBM PC systems project at Spectrum Control.

Here's what you'll learn from the Panel members in the "How To Set Up The IBM PC" video cassette:

- A live demonstration highlighting the functions of the entire system.
- Becoming familiar with the keyboard.
- How to get your printer on-line quickly.
- A Diagnostic Instruction Problem Analysis.
- Thorough schooling in all the functions of your IBM PC.

The "How To Use IBM PC DOS 2.0" video cassette shows you:

- How DOS 2.0 acts as an interpreter between you and your computer.
- A live demonstration on how DOS makes your job easier.
- You'll learn and master DOS commands.

Plus you also receive:

- Textbook (DOS 2.0 Only).
- Blank Diskettes.
- Sample File Diskette.
- Drive Identifiers.
- Starter Package of Printer Paper.
- Workbook.
- Library Case Package.

Now there's no reason to suffer confusion and panic over your IBM PC. Complete the attached order form and get your video cassettes today. And start getting the most out of your IBM PC.

Low-Budget Communications

Modems using the Bell 103 communications protocol provide no-frills, 300-baud connection between micros at low cost. Here are a few you might want to consider when you shop.

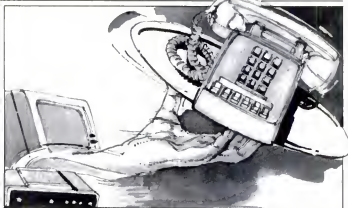

The crowded modem marketplace can be confusing, but you can simplify your search by determining your main concern before you begin to shop for one. If you're looking for a relatively inexpensive way to get your computer communication over the phone lines, a modem that is compatible with the Bell 103 protocol is your best choice.

The Bell 103 protocol is the oldest and most widely used scheme for modem communications. Its typical transmission rate of 300 baud (roughly 30 characters per second) is sufficient for most purposes. Perhaps most important, 103-compatible modems cost less than modems that use other protocols; 103-compatible modems come in a wide range of prices and features. Here's a look at some popular standalone modems that connect to your PC through a cable that plugs into the communications (RS-232) port on your system.

Hayes Smartmodem 300

The Smartmodem 300 is probably the most popular of the intelligent 103-compatible modems, and along with other Smartmodem models, it has become the de facto standard against which the competition is measured.

The Smartmodem is a full-featured, direct-connect modem (it plugs directly

into the phone system).

The "smarts" in the Smartmodem come in the form of firmware—programs written on a chip and installed permanently in the modem. This lets you control the modem either by typing simple commands at your keyboard or by using software. The Smartmodem 300 has 19 commands plus 16 registers that are the same as those for all Smartmodem models. Any communications program written for the Hayes command protocols will work with any Smartmodem model.

The Smartmodem 300 has five operating modes: manual answer, manual originate, automatic answer, automatic dial,

and automatic reverse dial (in which the modem will dial the phone and then go into answer mode). It also has a bank of seven status lights that keep you posted on what it's doing.

The Smartmodem 300's only drawback is its price. But at \$289, it is still significantly cheaper than modems using other communications protocols. If your major aim is low-budget communications, the Smartmodem may be more modem than you need. You may not want to pay for what amounts to sports car instrumentation on a low-horsepower, economy-model hatchback. If that doesn't bother you, though, this is the one to get.

(continues)

Novation J-CAT

The distinctly atypical, direct-connect Novation J-CAT is smaller and lighter than most modems—roughly the size and shape of a bar of soap. Novation suggests mounting it on the side of your phone, but I consider this arrangement clumsy and have yet to find a convenient place for it.

The J-CAT is atypical in other ways,

The Novation J-CAT may or may not work on your PC, depending on which communications card your machine has.

too. It doesn't require you to manually set it for either answer mode or originate mode. The J-CAT jumps back and forth between answer and originate modes, hunting for another modem to talk to. When it finds one, it locks itself into the proper mode. The J-CAT also has an auto-answer mode and an auto-dial capa-

bility, meaning that the modem is capable of dialing the phone but requires a program to tell it what to do.

One last, and very important, note. The J-CAT works only with selected communications cards. According to Novation, the J-CAT works with cards from Personal System Technology, Aparat, Quadram Corporation, AST Research, Seattle Computer, Chrislin Industries, PC Square, Tecmar, and STB Systems. It doesn't work with cards from Sigma Designs, Automated Business Machines, Datamac Computer Systems, Alpha Byte, and IBM.

VOLKSMODEM

The low-cost, direct-connect VOLKSMODEM is both easy to install and easy to use. "Easy to install" because it comes with its own RS-232 cable and all you have to do is plug it in. "Easy to use" because it's so basic.

To use the VOLKSMODEM, establish a phone connection, then turn on the modem. The phone goes dead, and the modem generates an audible tone. When it has established communications with another modem, the tone stops. The VOLKSMODEM automatically sets itself to answer mode or originate mode as appropriate, but it has no auto-answer or

auto-dial capabilities.

The VOLKSMODEM is one of the least expensive modems available. If you're looking for no-frills communications at bargain-basement prices, this is probably your best choice.

LEX-11 and LEX-12

Unlike the above modems, the LEX-11 is acoustically coupled, meaning that

The LEX-11 is an acoustically coupled modem, meaning it sends and receives communications through a phone handset.

it communicates through a phone handset. The handset fits into two rubber cups on the modem—the modem "speaks" through a built-in speaker, and "listens" through a built-in microphone. Thus, you can use this modem in situations where you can't plug directly into a phone line.

To use the LEX, you establish the phone connection, place the handset in the rubber cups, then turn the modem on in either answer mode or originate mode. The Lex is also available for purchase in a battery-operated model for use with a portable system.

Also worth looking at is the LEX-12. This modem is virtually identical to the LEX-11. Like the LEX-11, it can switch from a direct-connect modem to an acoustically coupled modem. While expensive, the battery-operated version of the LEX-12 is an extremely flexible telecommunications device.

That completes this whirlwind tour of some Bell 103-compatible modems. Keep an eye out for a look at the software side of communications. ■

10TH ANNIVERSARY SPECIAL OFFER

1984 is a banner year for CREATIVE COMPUTING. It marks our first decade of bringing you the latest information regarding introductions and changes that have occurred in our fast-paced industry.

We were there as the respected publication in the beginning... when businesses were struggling under reams of paper... when video games meant a dot bounding from one side of a TV screen to the other... when computer technology meant main frames and punch cards.

Before it happened we told you about the transition from tape to disks... telecommunications and networking simplifying business transactions... new programs eliminating hours of waste and unproductivity! We will be there for the next ten years because we are not going to rest on our laurels! 1984 is the beginning of a decade of fresh ideas, new innovations and reliable evaluations certain to keep you abreast of our quick-charged stimulating world!

SUBSCRIBE TODAY AND RESERVE YOUR COPY OF OUR SPECIAL 10th ANNIVERSARY ISSUE!

When you take advantage of our Special 10th Anniversary Discount, you automatically reserve this special November issue guaranteed to be a collector's edition!

OUR ANNIVERSARY GIFT TO YOU—A QUARTZ DESK CLOCK!

You will receive a 5-function lucite Quartz Desk Clock upon payment. This attractive clock, sure to become a collector's item, will be sent to all who participate in our historic celebration! Attractive in any decor, reliable and long lasting, this desk clock will give you years of enjoyment. Your subscription to CREATIVE COMPUTING will give you hours and hours of facts, information and quality reading, assisting you to make the most of your microcomputer!

Memory Management

Acquire a better understanding of one of the most important features of any operating system through this look at how DOS handles memory management.

PREVENT THE DISASTER OF HEAD CRASH AND DROPOUT.

The war against dust and dirt never ends. So before you boot-up your equipment, and everytime you replace a cassette, disk or drive filter, be sure to use Dust-Off II; it counteracts dust, grit and lint. Otherwise you're flirting with costly dropouts, head crashes and downtime.

Dust-Off II is most effective when used with Stat-Off II. Stat-Off II neutralizes dust-holding static electricity while Dust-Off II blasts loose dust away. There's also the Dual Extender and Mini-Vac for vacuuming dust out of hard-to-reach places.

Photographic professionals have used Dust-Off brand products consistently on their delicate lenses and expensive cameras for over ten years. They know it's the safe, dry, efficient way to contaminant-free cleaning.

Cleaning not provided by liquid cleaners.

Dust-Off II's remarkable pinpoint accuracy zeroes in on the precise area being dusted. And you have total control—everything from a gentle breeze for

Stat-Off II neutralizes dust-holding static electricity from media and machines.

delicate computer mechanisms to a heavy blast for grimy dirt.

Don't let contamination disrupt your computer operation. Stock up on Dust-Off II—the advanced dry cleaning system,

at your local computer or office supply dealer.

Or send \$1.00 (for postage and handling) for a 3 oz. trial size and literature today.

Dust-Off II

The safe dry cleaning system

Wine Data 3

Oenophiles rejoice! Now you can refer to a convenient data file to learn about various quality wines. In our previous two issues, we detailed the wines of France and Italy; now we offer our final installment treating the wines of California. From Chardonnay to Zinfandel, the state's most popular wines are evaluated according to grape variety. Learn about the origins and distinctive characteristics of these grapes, the wineries that produce them, and the vintages that are worthy of notice. Gather enough information to stock your cellar and intimidate wine stewards.

Curve Fitter

For those who work with mountains of data yet are not mathematically inclined, this program is a lifesaver. *Curve Fitter* helps you assemble and plot a set of data and then determines the relationship among the points. Using the least-squares fit regression method, the program chooses the type of curve that best fits your data, then plots it against the data points. The resulting curve—linear, exponential, second order, logarithmic, or power—helps you make projections. You'll never need to plot with paper, pencil, and eraser again!

Label Maker

If your personal or professional mailing list has degenerated into a motley assortment of tattered scraps overrunning your Rolodex, the time has come to seek help. With *Label Maker*, you can manage and store any kind of list, format tens of thousands of addresses to fit your label stock, and sort them alphabetically, up to 5,000 at a time. At home or in the office, you can become a pro at managing your mailing list.

File Manager III

Parts I and II of our disk management utility allowed you to list, rename, copy, or delete files on a disk; search for particular files; and print them in an adjustable format. The final program in the series saves you even more time and effort by enabling you to list your files on the screen in whole or in part. You no longer have to guess what your filename means or print the entire file to discover its contents. Use the complete *File Manager* package to display the file, scan through it, save portions to another file, or print it.

Coming Up

Zenith PC

Though not spectacular, the new Zenith PC is a very solid and competitively priced machine, whether with or without a hard disk. Was the quality there when the Zenith name went on? Our review will help you decide if this "me-too" PC-compatible is the machine for you.

Storage Alternatives

There's no longer any need to limit your data storage merely to floppies and Winchester hard disks. We'll look at some new ways of storing huge amounts of information and retrieving it quickly. Bubble memory, for instance, can retain added memory even when you turn off the machine. The Bernoulli box employs the Bernoulli effect from physics to provide fast access to data. Another unit stores an impressive half-gigabyte of memory.

Thor

The god of thunder, agriculture, and war once bore the name of Thor; now a software package does. But this time, *Thor* stands for THought ORganizer and its developers claim that it "processes thoughts" in the same way that a word processor processes words. Basically, the package is a hybrid—part database manager and part word processor—that captures, classifies, and helps organize thoughts. Does *Thor* succeed in this dual role?

DisplayWrite 1 and 2

DisplayWrite 1 and *2* closely emulate IBM's line of dedicated office word processors. John Dickinson will look at how they stack up as word processors, as well as at IBM's marketing strategy for the products and at the original dedicated DisplayWriters from which they are derived.

Mindset

Tom Christopher compares the Mindset PC with a racecar: fast and powerful when it's running, but temperamental. Mindset features a phenomenal graphics system that can obliquely angle images and selectively erase colors.

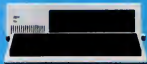

NEW — IBM PC VISUAL ENHANCEMENT SCREEN AND DUST COVERS

See what you read without fatigue!

Visual enhancement screen...

- reduces eye fatigue by eliminating reflection and glare
- has a handy pull-out tab for easy removal
- foam gasket assures a perfect fit

Protect your PC!

PC dust covers...

- provide protection from dirt, dust and smoke
- are custom designed for the IBM PC disk drive and keyboard
- manufactured with a smoke colored acrylic finish

Introducing the Most Powerful Business Software Ever!

TRS-80™ (Model I, II, III, or 16) • APPLE™ • IBM™ • OSBORNE™ • CP/M™ • XEROX™

The VERSABUSINESS™ Series

Each VERSABUSINESS module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSARECEIVABLES™

\$99.95

VERSARECEIVABLES™ is a complete menu driven accounts receivable, invoicing, and monthly statement-generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSARECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSALEDGER II™ and VERSAINVENTORY™.

VERSAPAYABLES™

\$99.95

VERSAPAYABLES™ is designed to keep track of current and aged payables, keeping you up to date with all information regarding how much money your company owes, and to whom. VERSAPAYABLES™ maintains a complete record on each vendor, prints checks, registers, vouchers, transaction reports, aged payables reports, vendor reports, and summary reports. With VERSAPAYABLES™, you can even let your computer automatically select which bills are to be paid.

PAYROLL™

\$99.95

PAYROLL™ is a powerful and sophisticated, but easy to use payroll system that generates government required payroll information. Complete employee records and all necessary payroll calculations are performed automatically, without need for operator approval. A payroll can be run totally, automatically, or can intervene to prevent a check from being printed, or to alter employee data. Total payroll amounts may be posted to the VERSALEDGER II™ system.

VERSAINVENTORY™

\$99.95

VERSAINVENTORY™ is a complete inventory control system that gives you instant access to your inventory. VERSAINVENTORY™ keeps track of all information related to what you have on hand, when it was purchased, and at what price. It can generate a perpetual reorder point, and allows you to enter and print inventory reports. VERSAINVENTORY™ system. VERSAINVENTORY™ prints reports of items below reorder point, inventory value reports, price lists, inventory checklists, etc.

VERSALEDGER II™

\$149.95

VERSALEDGER II™ is a complete accounting system that grows as your business grows. VERSALEDGER II™ can be used as a simple personal checkbook register, expanded to a small business bookkeeping system or developed into a large corporate general ledger system without any additional software.

- VERSALEDGER II™ gives you almost unlimited storage capacity (500 to 10,000 entries per month, depending on the system),
- stores all check and general ledger information forever,
- prints tractor-feed checks,
- handles multiple checkbooks and general ledgers,
- prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSALEDGER II™ comes with a professionally-written 360 page manual designed for first-time users. The VERSALEDGER II™ manual will help you become quickly familiar with VERSALEDGER II™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

CIRCLE 260 ON READER SERVICE CARD

SATISFACTION GUARANTEED!

Every VERSABUSINESS™ module is guaranteed to outperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any VERSABUSINESS™ module, you may return it within 30 days for a full refund. Manual for any VERSABUSINESS™ module may be purchased for \$25 each, credited toward a later purchase of that module.

On the Road with IBM: Vive la Différence à l'Expo

BY STEPHEN MANES

PARIS—In the shadow of the Eiffel Tower's technological wizardry, the Trocadero Gardens of Paris get one star from *Guide Michelin* for their surging fountains and broad-leaved trees. What better place to launch an exhibit with the theme of applying technology to the facts of nature?

Voilà! Under the spreading chestnut trees appears a bright, airy, plexiglass-and-wood quonset hut designed by Renzo Piano, a chief architect of Paris's controversial Pompidou Center. Inside is *l'Expo*, an IBM Corp. exhibit that will travel to 20 cities in 14 European countries over the next 3 years. Aimed at 15- to 24-year olds, the show struts IBM's stuff with a strong emphasis on applications.

"At *l'Expo*, the personal computer is king," declares one of the exhibit's lavish brochures. PCs and XT's (plus one lone Junior) are strewn about the hall, where they play interactive games, decipher voice commands, serve as videotex terminals, and generally do the things they do with great aplomb. But to those who've seen all that before, the real royalty of the show

is its hands-on glimpse into the past and future of computers.

One exhibit takes a look at the development of a chip (called a *puce*, the French word for "flea" or "tiddlywink") from raw silicon to integrated circuit. Visitors are allowed to peer through a microscope at IBM's first mass-produced 64K memory chip, dating from the "historic" days of 1978. Also on display are the high-density, water-cooled panels that go into IBM's top-of-the-line mainframes, plus Model 3380 disk drives with on-line storage of 2.5 gigabytes and access to 3 megabytes per second.

Super Screens

Model 3290 gas plasma screens, with their peculiar hi-resolution orange glow, which IBM has been quietly unveiling over the last several years, are almost as plentiful as PCs at *l'Expo*. Even more stunning are the highly realistic, 256-color floral images displayed on the Model 5080. And a Model 7350's demonstration of image enhancement lets you zoom in close on an aerial view of Paris.

Demonstrations of voice in-

put include a particularly impressive experimental program designed to "visualize" sound and help deaf children learn to speak more clearly. Various graphics tablets let visitors modify images and add captions to droll cartoons. Touch screens and icons have appeared in U.S. exhibits, but if IBM Europe has secret plans to join the Xerox Star and Apple Mac/Lisa bandwagon, it keeps them well hidden at *l'Expo*: not a single mouse is in evidence.

Esoteric hardware, on the other hand, is all over the place. The Model 4250 photocompositor is there, setting reproduction-quality type and illustrations on aluminumized paper. A Model 7535 industrial robot grasps U.S. Olympic coins and slugs in its spidery fingers and, under the guidance of a PC, puts them through a series of tests to distinguish the genuine from the fake.

Lasers get their due in the form of glass-slicing tools and holographic supermarket scanners. And a film from Big Blue's Zurich labs puts you closer than ever to the submolecular world with the help of a computer-

enhanced "tunnel effect" microscope that is able to take three-dimensional views with a vertical resolution of approximately one atom—almost 500 times better than previous limits.

Though *l'Expo* is hardware heaven, the show brochures are also notable, especially in contrast to IBM's dry U.S. brochures. One brochure, attempting to show how reality can be represented by a network of relationships among facts, uses such disparate concepts and personalities as infinity, death, Yuri Gagarin, Phaethon, and Teotihuacan to come up with a working definition of the sun.

In the master brochure, along with results of a poll of European youth (significantly more are interested in sports, arts, and leisure than in science), is the most surprising image of the whole show: a photo of Elvis Presley juxtaposed with album covers of the Beatles' *Rubber Soul* and the Nina Hagen Band illustrating an article, "Music and the Young: 25 Years of Rage, Myths, Fashions."

What's remarkable about this piece is that it must be the first official IBM document that recognizes the existence of Frank Zappa, Lou Reed, the Velvet Underground, the Clash, and—may God save the Queen—the Sex Pistols. So the most important question about technology and nature that *l'Expo* raises may well be this: Will the PCjr be marketed overseas as a punk computer?

Western Union's EasyLink Taps Into Tymnet

UPPER SADDLE RIVER, N.J.—Western Union's EasyLink electronic mail service is now only a local call away in more than 450 cities, thanks to Tymnet.

When the EasyLink service was first offered, there were 16 "Metropolitan Area Connect Numbers," which were part of Western Union's own packet-switching network; subscribers outside of these areas used a toll-free number.

While the announcement to

subscribers didn't mention Tymnet by name, Western Union now uses this national packet-switching network to provide additional access to EasyLink. The changes come as back U.S. Postal Service has cut back its electronic mail service.

Give and Take

Perhaps the best news is that there is no additional charge for using these local numbers. As before, Western Union charges only for sending messages, not for receiving them. The charges are based on time, and vary depending on the baud rate used, with discounts for off-peak and volume usage.

The "give" in the announcement is tempered with a little "take," however. One of the company's reasons for adding the Tymnet connections was the high cost of the toll-free service, according to a Western Union spokesperson. As a result, it has added a 15-cents-per-minute surcharge for connection to the toll-free number, effective in August. Also, any EasyLink message that has been left in a subscriber's "mailbox" more than 10 days will be delivered as a Mailgram Message, with a 50-cent charge to the recipient. This guarantees any message sent will eventually be delivered, even if recipients forget to check

their EasyLink mailboxes.

Nearly half the 60,000 EasyLink subscribers use microcomputers to hook in, and the percentage is growing rapidly.

Western Union also has aggressive plans to release a microcomputer communications program to simplify creating your messages off-line and to completely control dialing EasyLink, signing on, sending the message, and signing off. The program, due late this summer, also accesses other on-line services, and is expected to be just the first of many new products and features scheduled for the next 6 months. Western Union said.

Your IBM PC Or XT Graphics Are Only As Good As What's Under The Hood.

Get Smooth Clean Performance With Graphix Plus II™. Single Board Support Of Both Color *And* Monochrome Display.

When it comes to color/graphics adapter boards, your IBM Personal Computer—and you—deserve only the best. That's why Graphix Plus II gives you outstanding graphics...*and* a whole lot more. With Graphix Plus II, you'll get *50% faster, flicker-free scrolling* over IBM's color/graphics board. And, the Graphix Plus II is the *only* product on the market which provides *dual monitor support* for both RGB color and monochrome graphics on a single board. It gives you *full screen* (640 × 352) monochrome graphics and *high resolution* color graphics with the appropriate software. When two monitors are used, Graphix Plus II *automatically* shifts to the appropriate screen.

Luxury Items Are Standard Equipment

With the Graphix Plus II, you'll be glad to know extra conveniences come standard. For example, you get a parallel printer port which allows you to hook up any IBM compatible printer or SASI compatible hard disk controller. Our PC Accelerator™ software is included which gives you

the use of *two* RAM disks and a print buffer. Plus, you can access the screen RAM with absolutely no "snow" or flashing. Graphix Plus II also provides true gray scale display on composite video monitors, a light pen interface, 32K display RAM (text and graphics modes), compatibility with Lotus 1-2-3™ and other popular software packages. And much more. A battery operated clock/calendar is available as an option.

Puts You In The Driver's Seat

Graphix Plus II fits easily in any expansion slot inside your PC. And when you power up, you'll see the same high-powered quality you've come to expect from your machine. Incredibly smooth, versatile performance. From start to finish.

Graphix Plus II. So good, so reasonably priced, you might say...we've *outclassed* the competition. See your local dealer for all the details. Or call or write STB Systems, Inc., 601 North Glenville, Richardson, Texas 75081 (214) 234-8750.

WHAT A PAIR !

Tecmar's Graphics Master™ & Lotus 1-2-3[®]

Graphics Master is the only board that creates *both monochrome and color* graphics for Lotus 1-2-3.

You can also run IBM compatible software because Graphics Master emulates both the IBM Color Graphics Adapter and the Monochrome Adapter.

We are pleased to announce that Graf-Talk[®] and MetaWindow[®] software take full advantage of Graphics Master's high resolution graphics.

Graphics Master is the only board that will do all of the following with appropriate software:

- High resolution color graphics - 640 x 400, 16 colors
- High resolution monochrome graphics - 720 x 700
- Run software for IBM Monochrome Adapter
- Run software for IBM Color Graphics Adapter
